\*\* Jika Laporan PSM ini SULIT atau TERHAD, sila lampirkan surat daripada pihak berkuasa/organisasi berkenaan dengan menyatakan sekali sebab dan tempoh laporan PSM ini perlu dikelaskan sebagai SULIT atau TERHAD.

## **APPROVAL**

This report is submitted to the Faculty of Manufacturing Engineering of UTeM as a partial fulfillment of the requirements for the degree of Bachelor of Manufacturing Engineering (Process) (Hons.). The member of the supervisory is as follow:

.....  
(PROF. MADYA IR. DR. SIVARAO)

## **DECLARATION**

I hereby, declared this report entitled “Quality Investigation of Laser Wood Machining” is the results of my own research except as cited in references.

Signature : .....

Author’s Name : FONG YAN LI

Date : 29 MAY 2013

## ABSTRAK

Pengukiran kayu ialah sejenis kerja kayu dihasil daripada alatan tangan seperti pisau ukir dan penukul tangan. Cara pengukiran adalah menggunakan pisau ukir sahaja atau dengan penukul kayu sekali. Hasil pengukiran dikenali sebagai patung kayu atau perhiasan kayu. Industri pengukiran kayu adalah sangat popular di budaya Melayu dimana mereka akan menggunakan hasil-hasil ukir kayu di sektor perabotan atau kraft tangan. Reka bentuk dan profil untuk ukiran kayu adalah pelbagai jenis berdasarkan permintaan pelanggan. Memandangkan kebanyakan industri pengukiran kayu menggunakan cara tradisional untuk produksi mereka, banyak kelemahan telah ditemui dengan kegunaan cara tradisi. Oleh itu, cara alternatif dengan menggunakan mesin laser telah dicadangkan untuk menyelesaikan masalah yang ditemui dengan pengukiran secara manual. Untuk mencapai objektif yang dinyatakan dalam kajian ini, satu lawatan ke kilang ukir kayu telah dijalankan supaya informasi terhadap proses pengukiran kayu secara manual dapat diketahui dengan lebih jelas terutamanya kelemahan proses tradisi. Setelah melawat ke kilang itu, adalah mendapati bahawa permukaan hasil kerja adalah kasar dan menjejaskan kualiti pengukiran. Oleh itu, cara pemotongan dengan penggunaan mesin laser dicadangkan sebagai cara alternatif yang dapat meningkatkan kualiti pemotongan untuk kayu atas sebab kebaikan kualiti produk yang dapat dihasil dengan mesin laser. DoE ataupun dikenali sebagai “design of experiment” dalam bahasa Inggeris digunakan untuk menentukan bilangan set pemboleh ubah yang akan digunakan untuk menjalankan eksperimen di lanjutnya. Pemboleh ubah seperti kuasa laser, kelajuan dalam memotong, dan tekanan untuk gas yang digunakan dalam proses ditentukan sebagai pemboleh ubah yang boleh dimanipulasi dan kualiti pemotongan dikaji selepas eksperimen dijalankan. Kualiti produk yang bagus dapat dicapai dengan menggunakan kuasa 2.2 kW, kelajuan 1500 mm/min, dan tekanan gas 9 bar.

## **ABSTRACT**

Wood carving is a form of working wood by means of a cutting tool in one hand or a chisel by two hands or with one hand on a chisel and one hand on a mallet, resulting in a wooden figure or figurine, or in the sculptural decoration of a wooden object. This kind of industry is very popular in Malay culture either in agriculture or craft. The design or profile of wood carving can be varying based on how a customer required. As the wood carving industry is mostly used manual or conventional method in the production line, it was interested to find out the limitation of the traditional method, and thus propose a suitable process as the improvement method that to be used. For this study, laser machining had been chosen as the alternative method in order to cut the wooden product based on the advantages can be achieved by this method. In order to achieve the aims for this study, a visitation to a wood carving industry was done to search for more information about the conventional process. The main limitation by using conventional method was poor surface finish. Laser cutting had been proposed as the improvement method and design of experiment (DoE) was used to approach for this study. The parameters used in this study are laser power, cutting speed, assisted gas pressure, and focal length distance. The cut quality such as surface finish and kerf width are investigated to find out the optimum parameters for laser wood cutting. The optimum parameters to achieved good surface finish and narrow kerf width was using laser power 2.2 kW, cutting speed 1500 mm/min, and gas pressure 9 bar.

# **DEDICATION**

To my beloved parents

## **ACKNOWLEDGEMENT**

I would like to thank to my project supervisor Prof. Madya Ir. Dr. Sivarao who assisted and guided me in order to accomplish this project. The title of the project was “Laser Cutting of Wood” which is a combination of research and experimental based research. This investigation is proposed to wood carving industry in order to solve the problem meet by the industry which using conventional method, jigsaw as the cutting tool for the production. In conjunction to this, I would like to offer my deepest gratitude to Mr. Sivarao from the bottom of my heart for all the support, encouragement, and inspirations manage to obtain all the way through of this project. The excellent working relationship between my supervisor and me has provided me with bountiful knowledge and experience for the future. The help rendered to me is priceless, be in from the smallest of its kind to the largest.

Besides that, I also would like to thank to Mr. Mustazarin, who worked in a wood carving industry, had spent his time for my visitation and sharing his working experience to me. On the other hand, I also would like to thank to the technicians at UTeM who had exposed me to the LVD laser cutting machine, and helping me when I do the result analysis in metrology lab. Last but not least, it is thankful to all my family members, course mates, friends, and other parties who had helped me direct or indirect in all the way until completion of my project.

# CHAPTER 1

## INTRODUCTION

Wood carving is a form of working wood by means of a cutting tool in one hand or a chisel by two hands or with one hand on a chisel and one hand on a mallet, resulting in a wooden figure or figurine, or in the sculptural decoration of a wooden object. Most of the wood carving industry is using human power in its production line as it is an industry which involve the skills and knowledge that the operator has. Wood carving has been around just as long as man has been upon this earth. Due to wood being a material that will not withstand the test of time, wood carvings must be protected and taken care of if they are to endure. Wood carving is part and parcel of vernacular Malay architecture and craft in Peninsular Malaysia and Southern Thailand. Timber architecture, boats and canoes, hilts and sheath of weapons, musical instrument and utensils are adorned with carving motifs of flora, calligraphy, geometry, fauna and cosmic features. It is an art of partially removing wood from a board or a plank following specific motifs and orders (Ismail, 2002). In carving, Malay craftsmen demonstrated high skills of art manifesting abstract ideas into physical beauty. This manifestation developed through a long period whereby skills and knowledge of woodcarving was passed through apprenticeship. By imitating a carved masterpiece, a woodcarver gradually modifies the motifs and produces his own manifestation onto the timber piece.

Generally, the carved components are depicted in three incision modes: relief, perforated or a combination of both (Ismail and Ahmad, 2001). Some of the components are wall panels, ventilation panels of door or window, door leaves, railings, gables and their boards, and fascia boards that dominate the elevation of the buildings. The degree of complexity in carving varies from one component to another, intricate ones include door leaves and wall panels, and simple carvings include bargeboard and fascia board. The carvings also signify the status and ownership of the residents and display the skilfulness of the craftsmen. Within the differences in motif and modes of incision and layout, a common factor holds the architecture that is, it is mostly constructed from heavy hardwood species particularly Cengal, *Balanocarpus Heimii* sp. (Ismail, 2002). Apart from the skilfulness of the woodcarvers as one of the determining factors in creating the carving, the other factor is the abundance of tropical hardwood species. Thus timber constructions such as house, mosque, palace, entranceway or gateway, tomb and pavilion, and boat are made from heavy hardwood species which are strong and durable and resist the attacks of fungi, powder-post beetles and termites.

## **1.1 Background**

It was interested to figure out the method used by most of the wood carving industry and learnt on it. One visitation on wood carving industry had been done to gather the information needed to approach on this study.

Mr. Mustazarin bin Abdul Majid who live in KM34, Jalan Haji Yahya, Parit Perawas, 77400 Sungai Rambai, is a person who work as a wood carving manufacturer. He has worked in wood carving industry (Anjung Ukir Enterprise) in three years and all the products are produced based on his knowledge and experience. Anjung Ukir Enterprise is a small wood carving industry which is a home-based industry. The method used by Mr. Mustazarin to produce wood

sculptural is jigsaw, driller, and grinder. The wood sculptural produce by Mr. Mustazarin is more on decorations for building (which used to hang on the wall), wooden boxes, and small cupboards. Figure 1.1 shows the wood carving products which made by Mr. Mustazarin.

Figure 1.1: Wood carving product which used to decorate fence or staircase

There are three types of materials used to produce the products. They are Meranti (Merah and Putih) – *Shorea* sp., Mersawa – *Anisoptera grossivenia* sp., and plywood. Each wood are with different thickness: Meranti (1 cm – 2 cm), Mersawa (1.8 cm – 1.9 cm), and plywood (3 mm, 5mm, and 9 mm). Each type of wood will then used for different profiling.

The steps for wood carving process involved drafting patterns, drilling, sawing or cutting (profiling), trimming, and coating. Table 1.1 shows how the processes done to produce a carving product.

Table 1.1: Steps for manually or conventional wood carving process

Process	Picture
<p><u>Prepare pattern:</u></p> <p>The pattern or design was the idea either from the customers or the manufacturer. The design can be vary based on the customers' requirements. The design was drawn out in a cardboard which will then transferred to wooden material later.</p>	
<p><u>Drafting the pattern on material:</u></p> <p>After preparing the pattern, the design was transferred to the raw material such as Meranti, Mersawa, or plywood. The thickness of material used was based on the function of the products.</p>	

Drilling:

Drilling was used to create a starting point for profiling. This is because the carving pattern was with the hollow parts in the centre of the wood. After drilled a hole, the blade can insert through the hole and start for the profiling process.

Profiling:

Jigsaw is used as the tool for profiling. There are many sizes for the blade. Large size blade was used to cut simple profile and cut off large area. Small size blade was used to cut the small hole or area, and normally is used to cut the sharp edge.
