DECLARATION

I hereby, declared this report entitled “Assessment of Thermal Comfort among Library Staff in Library Centre Universiti Teknikal Malaysia Melaka” is the results of my own research except as cited in references.

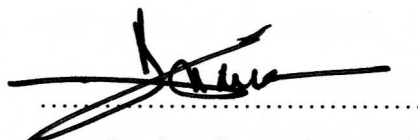

Signature : 

Author's Name : Fatin Afiqah Binti Jajuli

Date : 18th December 2014

APPROVAL

This report is submitted to the Faculty of Engineering Technology of UTeM as a partial fulfillment of the requirements for the degree of Bachelor's Degree in Mechanical Engineering Technology (Refrigeration and Air Conditioning System) (Hons.). The member of the supervisory is as follow:

.....
(Project Supervisor)

ABSTRAK

Keselesaan terma adalah keadaan fikiran di mana menyatakan kepuasan dengan persekitaran nya. Ia adalah satu aspek penting dalam proses reka bentuk bangunan di mana manusia moden menghabiskan masa mereka di dalam bangunan.. Oleh kerana keselesaan terma mempunyai peranan yang besar kepada penghuni , kajian ini mensasarkan dalam menentukan tahap keselesaan terma di kalangan kakitangan di pusat perpustakaan Universiti Teknikal Malaysia Melaka (UTeM). Ini boleh diperolehi dengan mengambil ukuran faktor yang boleh mempengaruhi keselesaan terma iaitu suhu udara, suhu pancaran persekitaran, kelembapan, halaju udara, penebatan pakaian, dan kadar metabolisme. Persepsi penghuni juga diambil kira melalui soal selidik dan dihubungkan dengan hasil ukuran parameter untuk mengesan hubungannya dengan tahap keselesaan terma. *Predicted Mean Vote (PMV)* dan *Predicted Percentage Dissatisfied (PPD)* yang telah dikira menggunakan data faktor keselesaan terma menunjukkan bahawa ia memenuhi standard yang disyorkan oleh *American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE)*.

ABSTRACT

Thermal comfort is the state of mind in which expresses satisfaction with the thermal environment. It is an important aspect of the modern building design process as man spends most of the day indoors. As thermal comfort has a significant importance to occupants, this study mainly aiming on determining the level of the thermal comfort among the staffs in the library centre of Universiti Teknikal Malaysia Melaka (UTeM). This can be obtained from the measurement of the parameters that contributing to the thermal comfort which are air temperature, mean radiant temperature, relative humidity, air velocity, clothing level, and metabolic rate. The perception of the occupants were also been considered from the questionnaire survey and being correlated with the parameter measurement result in order to find its relationship with the thermal comfort evaluation. *The Predicted Mean Vote* (PMV) and *Predicted Percentage Dissatisfied* (PPD) that have been calculated from the comfort parameter data showed that it is comply with the *recommended American Society of Heating, Refrigerating, and Air-Conditioning Engineers* (ASHRAE) Standard.

DEDICATION

Dedicated to my beloved parents, brothers, sisters, all my family and my friends.

Thank you for your support and encouragement.

You are all everything to me.

May Allah bless all of us. InsyaAllah.

ACKNOWLEDGEMENT

I would like to thank express my sincere gratitude to my academic supervisor, Mr Azwan bin Aziz for his guidance, constant motivation and research support throughout my degree program. His technical advice and suggestion helped me overcome hurdles during this study and kept me enthusiastic and made this work a wonderful learning experience. I am grateful to my parents Mr Jajuli bin Anuar and Mrs. Rohana bin Ibrahim for their love, support and guidance. They have always been supportive of my academic pursuits and stood by me every step of the way regardless of my decisions. To all my fellow friends who involves directly or indirectly which always stay strong beside me in giving opinions and support throughout our relationship, I really thankful and appreciate it very much.

CHAPTER 1

INTRODUCTION

In this chapter, some related information about the thermal comfort is discussed as the introduction for this research. In order to elaborate more ideas about this research, the background of research, problem statements, objectives and also scope and limitation of the research will also being explained in this chapter.

1.1 Background of research

The research is conducted to determine about the level of thermal comfort among the workers in the Universiti Teknikal Malaysia Melaka (UTeM) library. The library is situated at the UTeM's main campus.

1.1.1 UTeM Library Background

Figure 1.1 below shows the UTeM's library that is situated at the main campus. On 10 June 2001, the library started its operation at the Temporary Campus located in Taman Tasik Utama, Ayer Keroh, Melaka then it was been relocated to the Industrial Campus on 12 September 2005. Initially, this library could accommodate approximately 400 users in area of 2,229 square meters.

Figure 1.1: Main library in UTeM

In 1 October 2007, a new branch library was built in the City Campus located at Jalan Hang Tuah, Melaka. After two years been in operation, it then moved from Industrial Campus to Main Campus in Durian Tunggal. This main library can be filed about 500 users per time. It started the operation on September 2009. The Industrial Campus Library was closed on 3 September 2009. This library has about 81,530 collection of printed source including e-books, journals and database. The features of the existing facilities have been improved by the expansion of knowledge resource for the research, teaching, and learning needs.

1.1.2 Thermal comfort importance in library

Thermal comfort is one of six key metrics within indoor environmental quality. According to Nazanin *et al* (2008), each person has different physiological and psychological factors. In economically developed countries, it is commonly estimated that a person spend at least about 80% of their daily time in indoors. Thus, it is important to maintain the quality of the indoor environment. The quality of the indoor environment can have a large impact on comfort, health, and overall sense of well-being. In order to maintain the quality of the indoor environment, it is important to mechanically condition a buildings to provide constant, uniform, “comfortable” environments (ASHRAE, 1997) .The Health & Safety Executive (HSE) (2005) has assured that the “best that you can realistically hope to achieve is a thermal environment that satisfies the majority of people in the workplace, or can be simply

said as, 'reasonable comfort'. The HSE also has assumes that reasonable limit for the minimum number of people who should be thermally comfortable in an environment of occupants should be 80%".

It is important for an educational building such as library to have a comfortable and satisfying indoor environmental space. A staff perception of thermal comfort is affected by air temperature within the space, air movement or velocity, humidity, the clothing they worn, amount of physical work activity done in within their working period, mean radiant temperature, such as the average temperature of the walls, floor windows and many other factors (ASHRAE,1992). Thermal comfort in library should be considered seriously because of the high occupant density in the building. It will bring the negative influences to the not only to the staff but also the library user especially students which spend most of their free time in. Poor indoor air quality and thermal environment can causing occupants dissatisfaction and discomfort, a reduction in work performance and a greater incidence of absenteeism (HSE,2005). Poor conditions can also affect occupants health, causing some physical symptoms or also known as sick-building syndromes such as headaches, nose, throat, eye and skin irritation, nausea and drowsiness.

The assessment of thermal comfort has been done basically by referring to the number indices and standards that has been published. Fanger's Predicted Mean Vote (PMV) and Predicted Percentage Dissatisfied (PPD) model was the most well-known model on determining the index of the thermal comfort (Fanger, 1967).

1.2 Problem statement

For a past few decades, the public awareness towards thermal comfort in Malaysia is on the rise. As Malaysia is located in a hot and humid climate, a large number of the buildings are served by air-conditioning and other mechanical ventilation systems that are designed in order to maintain a comfortable indoor environment. Thus, there is a need to conduct a study on air-conditioning building such as library in university, especially in Malaysia because it is rarely been done. Recently, occupant's complaints have rising, productivity also has fall and in some cases people may

refuse to work in a particular environment as it causing uncomfortable feeling (Awbi, 1992). Symptoms of sick building syndrome to occupants will be affect occupants health if the environmental factors are not be maintained with adequate standard. Thermal comfort is a key component of ensuring a high indoor air quality. Environmental elements such as heat from electrical lighting, lack of adequate ventilation, high humidity levels can also resulting to poor thermal comfort.

It is essential in educational buildings to have a satisfactory and comfortable indoor conditions in order to achieved significant health, performance and learning improvements for students and staff (Kats, 2006; Corgnati, Filippi & Viazzo, 2007). Thus, due to the daily use of library, the problem arising is how the thermal comfort for the occupants is maintained within their working period. Some occupants' complaints that they were sometimes feel uncomfortable with the humidity and temperature. Thus, in order for a thermal comfort to be achieved, a good maintenance on heating, ventilation and air conditioning (HVAC) is necessary. Care should be taken when air conditioning systems are been used to ensure uniform air distribution throughout the workplace or otherwise some workers may complain regarding their satisfaction in the environment.

1.3 Objectives

1.3.1 Main Objective

- To determine the level of the thermal comfort among the staffs and its relationship with air conditioning status in the library centre of Universiti Teknikal Malaysia Melaka (UTeM).

1.3.2 Specific Objectives

1. To measure the thermal comfort parameters such as air temperature, mean radiant temperature, relative humidity, air velocity, clothing level, and metabolic rate.

2. To calculate the value of Predicted Mean Vote Index (PMV) and Predicted Percentage Dissatisfied Index (PPD) in determining the performance of the thermal comfort.
3. To determine the response of occupants regarding to thermal comfort in the Library centre, UTeM.
4. To correlate the relationship between thermal comfort and the air-conditioning status in the library.

1.4 Scope and Limitation of Research

This research is mainly focus on the thermal comfort at the library which including several units which are Administration unit, Automation unit, Circulation unit, Media unit, Reference unit, Indexing unit and Procurement unit. The focus of this research is to analyze how the effectiveness of the air-conditioning system in the library may have an effect on the thermal comfort of the occupants. Complaint from the library users especially the staffs has increase on how they sometimes feel uncomfortable with the air-conditioning system within the building which could become too cold or sometimes feel hot.

So, this research will be focusing on determining the level of the thermal comfort in order to detect the problem that has been affecting the effectiveness of the air-conditioning system. However, this study only proposes on obtaining the occupants' response on their awareness regarding thermal comfort only without considering the improvement or solutions to solve the problems.

1.5 Expected outcomes

This research projects expects to have some outcomes by the end of the project:

1. Able to determine the level of the thermal comfort measurements of environmental parameters by measuring the parameters contributing to thermal satisfaction.

2. An analysis on the factor that affect the level of the thermal comfort and also some of the consequences when the thermal comfort is decrease.
3. Provide the staff or occupants a comfortable thermal environment that will increase the working performance from the assessment of building occupant's thermal comfort over time.
4. Increase the awareness of the importance of the thermal comfort in order for the occupants to work on a healthy environment.
5. Ensure a healthy IAQ in the library when the air-conditioning system is in a good maintenance.

CHAPTER 2

LITERATURE REVIEW

2.1 Introduction to thermal comfort

A thermally comfortable environment is always been a priority for every human. American Society of Heating, Refrigerating and Air Conditioning Engineers , ASHRAE 55-92 and ISO/EN 7730 has stated thermal comfort as a condition of mind which expresses satisfaction with the surrounding thermal environment. There have been a complex relationship between physiological and psychology variation of each person and condition of their mind. In case for occupant in a building it basically will relate with the heating, ventilation and air conditioning system (HVAC) (ASHRAE, 1993; Humpreys, 2007). The complex relationship is presented in the Thermal Interaction of Human Body and the Environment in Figure 1.2. According to ASHRAE (1993) this cylindrical model displays the regulation of human body functions and activities in which will associate with the dissipation of heat, generation and storage of human body.
