Supervisor's Name : Dr. Wong Yan Chiew

Date : 2nd June 2017

Special thanks to my family, project supervisor, friends and other staffs in UTeM

ACKNOWLEDGEMENT

This acknowledgement was written as I completed the thesis in Universiti Teknikal Malaysia Melaka. I have taken effort and time in order to complete the thesis. It is impossible without the kind support and help of many individuals. Hence, I would like to expand my deepest gratitude to all who had directly and indirectly guided or gave me inspiration in performing the final year project.

First of all, I would like to take this golden opportunity to express my deepest gratitude to my supervisor which is Dr. Wong Yan Chiew for her inestimable guidance. As I know, she is a very good supervisor. Thanks so much for taking time from busy schedule to give any guidance along the final year project. The supervision and support gave truly help on the progression and smoothness along the final year project. I am thankful for her continuous guidance, support, teaching and answering all my endless questions regarding my project. Her kindness, her leadership and her word of wisdom will kept close to my heart at all times.

Besides, I would like to thank the staffs of Faculty of Electronics and Computer Engineering for their assistance and readiness to share their knowledge to complete the final year project. With the knowledge sharing, I had obtained good understanding regarding RF energy harvesting.

Apart from that, I would like to convey my gratefulness and appreciations to my beloved parents and family who are giving me any spiritually, emotionally and mentally support throughout the project, and thus making this journey to be such a wonderful experience for me.

ABSTRACT

Limited life span of the battery usually limits the operating time of the devices in wireless sensor network (WSN). Although solar energy harvesting could be one of the ways to solve the problem, but due to the blackout period and weather problem, it becomes not practical. Therefore, Radio Frequency (RF) energy harvesting can be an alternative to solve this problem. Nowadays, there are a lot of wireless communication network exists in the world such as mobile network, WiFi and satellite communication network. RF energy is one of the energy sources where it is essentially inexhaustible. It is time independent and a kind of easily obtained energy source. RF energy harvesting system can be used to convert the RF energy to an amount of electrical energy that is possible to power up an application in wireless sensor network. RF energy harvesting system makes wireless sensor network becomes more practical in cost, size and lifespan. In this project, an RF energy harvesting system that is operating at 915MHz is designed. With the use of direct RF input, 50.42% of power conversion efficiency at -5dBm is achieved. On the other hand, with the use of receiving antenna, 23.06% of the power conversion efficiency at -5dBm is achieved as well. The RF energy harvesting system is designed by using the Advanced Design System (ADS) software. Then, the layout design of the RF energy harvesting system is design by using the Momentum Software. The process is followed by developing the harvester by using off the shelf components. Lastly, the overall simulation result and the experimental result has been recorded, analyzed and discussed clearly as well.

ABSTRAK

Jangka hayat terhad bateri biasanya menghadkan masa operasi peranti dalam rangkaian sensor tanpa wayar. Walaupun penuaian tenaga solar boleh menjadi salah satu cara untuk menyelesaikan masalah ini, tetapi disebabkan tempoh malam dan masalah cuaca, ia tidak menjadi praktikal. Oleh itu, Frekuensi Radio (RF) penuaian tenaga boleh menjadi alternatif untuk menyelesaikan masalah ini. Pada masa kini, terdapat banyak rangkaian komunikasi tanpa wayar wujud di dunia seperti rangkaian mudah alih, WiFi dan rangkaian komunikasi satelit. Tenaga RF adalah salah satu sumber tenaga di mana ia adalah pada dasarnya tidak akan habis. Ia bebas dari masanya dan adalah sejenis sumber tenaga yang mudah diperolehi. Sistem penuaian tenaga RF boleh digunakan untuk menukar tenaga RF kepada sejumlah tenaga elektrik yang mungkin untuk memberi kuasa kepada satu aplikasi dalam rangkaian sensor tanpa wayar. Sistem penuaian tenaga RF membuat rangkaian sensor tanpa wayar menjadi lebih praktikal dalam kos, saiz dan jangka hayat. Dalam projek ini, sistem penuaian tenaga RF yang beroperasi pada 915MHz direka. Dengan penggunaan input RF langsung, 50.42% daripada kecekapan penukaran kuasa di -5dBm dicapai. Sebaliknya, dengan penggunaan antena, 23.06% daripada kecekapan penukaran kuasa di -5dBm juga dicapai. Sistem penuaian tenaga RF direka dengan menggunakan Advanced Design System (ADS) Software. Kemudian, reka bentuk susun atur sistem penuaian tenaga RF direka dengan menggunakan Software Momentum. Proses ini diikuti dengan menghasilkan penuai dengan menggunakan komponen elektronik. Akhir sekali, hasil simulasi keseluruhan dan hasil eksperimen juga telah direkodkan, dianalisis dan dibincangkan dengan jelas.

CHAPTER 1

INTRODUCTION

1.1 Project Overview

RF Energy is one of the energy sources where it is essentially inexhaustible. It is time independent and a kind of easily obtained energy source. This essentially free energy source is maintenance-free. Besides, it is more practical in cost, size and lifespan. When RF energy harvester is designed and installed properly, it can be used to convert the RF energy to an amount of electrical energy that is possible to power up an IoT application or low power devices which is more reliable than using batteries. In this project, an RF energy harvesting system will be designed and developed based on off-the-shelf components. The system includes antenna, impedance matching network and rectifier DC load circuit. The system will be designed using the Advanced Design System (ADS) software.

1.2 Problem Statement

Energy is everywhere in the environment surrounding us which are available in the form of thermal energy, solar energy, wind energy, and mechanical energy.

However, the energy from these sources is often found in such minute quantities that it cannot supply adequate power for any viable purpose. In practical wireless sensor usage, the need for a battery limits the application space and increases initial and recurring costs, making traditional wired sensors more appealing in some cases. When the usage of the battery has gradually increased, the deposition of the battery causes the environment pollution as well. The harmful chemical such as lead and lithium poses health issues to mankind and animals if the batteries are throwing to the landfills. Therefore, it comes to a solution where the solar energy harvesting is used for power up the wireless sensor. The use of solar energy in energy harvesting wireless sensor networks (WSNs) has increased for practical applications due to the higher energy density harvested as compared to other energy harvesting technique. However, solar power strongly depends on sunlight and therefore it is hardly to harvest energy during night time. Besides, the amount of the harvested energy depends on the weather as well. Therefore, in order to activate a sensor node during night time, it must be equipped with rechargeable batteries. These rechargeable batteries require extra recharging circuit and are usually expensive. Hence, RF energy harvesting can be an alternative and viable source of energy due to its availability at all hours and it is not depends on blackout period and weather. Due to the fact that in the modern environment, there are multiple wireless sources of different frequencies radiating power in all directions, thus, RF energy harvester can be considered as one of the best energy harvesting that can generate electrical power by using these unlimited sources.

1.3 Objectives

The main objectives of this project are:

- (i) To design a RF energy harvesting circuit.
- (ii) To develop a RF energy harvesting circuit.
- (iii) To develop proof of concept RF energy prototype based on off-the-shelf components.

1.4 Scope of Project

This project will cover the RF energy harvesting circuit design simulation and its prototype fabrication. The circuit design will be simulated by using Advanced Design System (ADS) software. Then, the desired schematic diagram is transformed to the layout in the electromagnetic simulator, Momentum. Off the shelf components such as antenna, RF receiver, capacitors, and resistors will be used as the system design. The RF energy harvesting circuit should be able to function at 915MHz and produce a stable DC output voltage and store it in a storage element. A laboratory experiment will be carried out to determine the functionality and performance of the prototype. The parameters involve in this project includes RF input power (dbm), output voltage (V), output power (W) and power conversion efficiency (%). Apart from that, antenna design is not covered in this project.

1.5 Significant of Study

This project will shows the capability of RF energy harvesting from the ambient electromagnetic energy produced by the radio telecommunication devices. Electromagnetic energy is ubiquitous in our daily life. Energy harvesting devices will utilize the power resources available in the surrounding. This is one of the alternative power sources for electricity and this renewable energy is most feasible. Thus, the battery lifetime problem and the burden of battery replacement of the wireless sensor network can be solved directly. Furthermore, this project will also helps in the growing demand of portable power devices where there are a lot of mobile devices that function by using battery that need a constant recharge. Therefore, this is another solution for battery fast drain problem where recharging process can be done wirelessly in anywhere and away from the power supply unit.

1.6 Report Outline

This thesis consists of five main chapters. It explains and discusses the details of each chapter as follow:

Chapter 1 – Introduction

This chapter discusses about the introduction of this project. The introduction includes the project overview, problem statement, objectives of project, scope of project, significant of study and the report outline throughout the project.

Chapter 2 – Literature Review

This chapter consists of literature review. Any information or study related to the radio frequency energy harvesting will be further described, summarized, evaluated and discussed in this section. The literature review is based on the reference of previous study from other researchers.

Chapter 3 – Methodology

This chapter highlights the methodology of the project. In this section, the procedure of the design approach is elaborated and the implementation of the project is clearly explained.

Chapter 4 – Results and Discussions

This chapter consists of the results and discussion of the project. This chapter focuses on the simulation and the measurement results. The experiment setup and the measurements result of the completed prototype are introduced to test for its functionality. Then, the results and findings are compared and discussed in this chapter as well.

Chapter 5 – Conclusion and Recommendation

The last chapter concludes the overall results of the project and examines either the objectives of the project are fulfilled. The recommendation and the future works of this project are also proposed in this section.

CHAPTER 2

LITERATURE REVIEW

2.1 Overview

This chapter discusses about the concept of the radio frequency energy harvesting and the related information regarding to the previous work from other researchers.

2.2 RF Energy Harvesting

Energy is everywhere in the environment surrounding us. Energy is available in the form of thermal energy, solar energy, mechanical energy and wind energy. There is a lot of active research in investigating alternative ways to capture energy from environment. Advanced technical developments have increased the efficiency of devices in capturing trace amounts of energy from the environment and transforming them into electrical energy. These developments have sparked the interest in the engineering community to develop more and more application that utilizes energy harvesting for power. One of the energy harvesting sources for power
