(Project Supervisor)

## **ABSTRAK**

Hari ini, lebih daripada separuh penduduk dunia menetap di bandar-bandar; pada 2050, terdapat hampir dua pertiga daripada semua orang di dunia ini akan menetap di kawasan metropolitan perbandaran. Pertanian tradisional tidak dapat menyediakan megacities itu dengan khasiat yang cukup sihat. Oleh sebab penduduk semakin bertambah dalam dunia ini, kekurangan tanah ladang, dan kebimbangan keselamatan makanan, penyelesaian terbaik adalah membawa pertanian bandar dengan diri sendiri. Pertanian bandar bermaksudnya mengamalkan penanaman, pemprosesan, dan mengedarkan makanan di dalam atau di sekitar kampung, pekan atau bandar. Kebelakangan ini, banyak syarikat telah terlibat dalam kilang tumbuhan dengan teknologi yang berbeza dan reka bentuk yang berlainan taman pintar. Sedia ada taman pintar di pasaran pada masa kini yang menggabungkan dengan mereka teknologi mesti mengatasi beberapa isu asas: tidak mencukupi tambahan cahaya, kos pengeluaran mahal dan reka bentuk tidak menarik. Tujuan projek ini adalah untuk mereka bentuk taman pintar yang berciri-ciri praktikal dan padat dan membina prototaip taman pintar dengan sistem air penjimatan air dan ciri-ciri sistem lampu penjimatan kuasa. Dalam usaha untuk mengoptimumkan kos taman pintar dan mereka bentuk taman pintar dengan sistem penanaman yang berbeza, reka bentuk yang berbeza dan ciri-ciri yang berbeza daripada produk taman pintar yang sedia ada di pasaran, projek ini juga bertujuan untuk melaksanakan taman pintar dengan konsep teknologi hijau dan sangat rendah kos dibelanjakan.

## **ABSTRACT**

Nowadays more than half of the world's populace lives in cities; in 2050, there are nearly two thirds of all individuals on soil will live in urbanized metropolitan ranges. Conventional agriculture will not be able to supply such mega cities with sufficient healthy nourishment. Therefore, due to a continually expanding world populace, a diminish of cultivate land, and nourishment security concerns, carrying urban farming by self is the best solution. Urban farming, which implies is the practice of cultivating, processing, and distributing food in or around a village, town, or city. Lately, many companies have gotten involved in plant factories that with different technologies and different design of smart garden. Existing smart garden in market nowadays that combine with those technologies must overcome some fundamental issues: insufficient supplemental of light, expensive manufacturing cost and unattractive design. The purpose of this project is to design a smart garden that are practical and compact features and develop a smart garden prototype with water-saving watering system and power-saving lighting system features. In order to optimize the cost of smart garden and design a smart garden with different planting system, different design and different features from existing smart garden product in the market, this project also aim to implement the smart garden with go green technology concept and very low cost spent.

## **DEDICATION**

Every challenging work needs self-efforts as well as guidance of elders, especially those who very close to our heart.

My humble effort I dedicate to my sweet and lovely

Family members

Whose affection, encouragement and prayers of day and night make me able to get such success and honour.

Project supervisor, Encik Mohd Kamal bin Musa,  
Project co-supervisor, Encik Mohd Qadafie bin Ibrahim

Along with all hardworking and respected

Lecturers and friends

## ACKNOWLEDGEMENT

First of all, I am very thankful to my family for their lovely, support and encouragement for being with me on each and every step of my life.

I wish to express my deepest gratitude and appreciation to my supervisor, Encik Mohd Kamal bin Musa and co-supervisor Encik Mohd Qadafie bin Ibrahim for their ideas, guidance, motivation and help throughout my research. A very huge graceful was given to them, a lot of comments and ideas were given to me for helping me achieve the goal of the final year project. Furthermore, they help me a lot in checking my document report needed to be presented and suggest the best solution for me in order to solve my peradventure.

I feel very thankful for their insightful advice and suggestions. Without their support and guidance, it is impossible for me to complete my research successfully.

Special thank also to my panel who also as my examiner, Encik Mohd Nazri bin Ahmad for his guidance and helps in improvement of project in terms of ideas related to design and suggestion regarding the design theme.

Besides that, I also wish to thank to a gardener, Mr Gan for his experience in farming to vegetables, who has shared a lot of experience and knowledge about farming and gardening with me. These help me a lot, which those knowledge cannot access by reading or referring from journal.

I also thank to my BETD's course mate who have given supports to help me during this research. Last but not least, I would like to thank all the lecturers who taught me throughout my education at Universiti Teknikal Malaysia Melaka.

PGR - Plant Growth Rate

# CHAPTER 1

## INTRODUCTION

### 1.0 Overview

The overall goal for this chapter is to introduce the approaches of this project. Firstly, the general idea has been discussed and followed by the problem statement of this project has been identified. Next, the aim of the project has been explained clearly and the extent for implementation of this project has been stated. Meanwhile, this chapter has been also discussed the overall thesis structure of this project.

### 1.1 Background

Today more than half of the world's population lives in urban area; in 2050, there are almost two thirds of all people on earth will live in urbanized metropolitan areas. Until 2050, the number of individuals living in urban ranges is anticipated to rise to more than six billion, 90% of them in creating nations (UN, 2013). This uncommon blast and development of mega-cities around the world may demonstrate unsustainable and environmentally sad. Besides, in today's busy society, people pay more attention and spend more time to their job than to their own health. Thus, most of the people nowadays because of their busy, they solve their three meals a day casually outside. In fact, outside food can bring the convenience, but more is unhealthy. Besides, many gardeners have put chemical fertilizers on their crops to avoid damage from pest insects. Therefore, most of the vegetables we buy are filled with chemical substances. According those phenomenon, one of the solutions in used for increasing agricultural production without land planting and without chemical substances is carrying urban farming by self.

This Indoor Organic Eco-Smart Garden is a concept for growing a vegetable garden in the kitchen, without help from sun or rain. It is a fastidiously designed, self-growing cultivate that revolutionizes how new nourishment is developed. This self-growing cultivate makes a difference all plants flourish, naturally making beyond any doubt they have the right sums of water, light, oxygen, and supplements. With solid nourishments developed right on windowsill, people can enjoy a higher quality of life. This Indoor Organic Eco-Smart Garden is designed with either can attached with the wall of kitchen or just leave it alone by self.

## **1.2 Problem Statement**

In this project, the improvement for the smart garden focus to supplemental light, cost and a smart garden with different system, design, and features. Supplemental light is important for plants to help them carry out the photosynthesis process. Hence, supplemental light would be required in arrange to get economically viable yields. Other than that, the supplemental light could be provide light in 24 hours. This means that the supplemental light must selected suitable used for 24 hours continuously and ensure sufficient light supply for plants. For implementation and innovation to this existing product, one of the main requirements is reducing its cost. There are many smart gardens sold in the market, where they are designed with different planting system, different design, different features and so on. However, the cost of them mostly are very expensive. According to Bruce Bugbee, a crop physiologist at Utah State University, believes that the power demands of urban farming will be too costly and uncompetitive with traditional cultivating using only free natural light. The environment author George Monbiot calculated that the fetched of giving sufficient supplementary light to grow the grain for a single loaf would be almost \$15. An article in the Economist argued that "even though crops growing in a glass skyscraper will get some natural sunlight during the day, it won't be enough," and "the cost of powering artificial lights will make indoor farming prohibitively expensive".

Once the project has been endorsed, but before substantial resources are applied, a pre-project planning activity takes place. At this point, the earlier opportunity statement has been rewritten as a product vision statement. In order objective defined by a product vision statement may be very general. To provide a clear guidance, a more detailed definition of the target market and of the assumptions under which the development team will operate have been formula. And following is the mission statement for this project outcome product, Indoor Organic Eco-Smart Garden:

Table 1.1: Mission Statement of Indoor Organic Eco-Smart Garden

<b>Mission Statement: Indoor Organic Eco-Smart Garden</b>	
<b>Product Description</b>	<ul style="list-style-type: none"> <li>• Can irrigating the plants automatically.</li> <li>• Can provide light to the plants when switch on the system.</li> <li>• Can fertilize the crops automatically.</li> </ul>
<b>Key Business Goals</b>	<ul style="list-style-type: none"> <li>• Be widely used in daily life.</li> <li>• Serve as practical and compact size to fit and save the housing area space for urban citizens.</li> <li>• Serve as time saving, chemical free and transportation free product.</li> <li>• Serve as platform for all future horticulture field products and solutions.</li> </ul>
<b>Primary Market</b>	<ul style="list-style-type: none"> <li>• Capture 50% of electronic product sales in primary market</li> <li>• Environmentally friendly</li> <li>• Office departments, urban residential (minimum 500sqft, without balcony amenities)</li> </ul>
<b>Secondary Markets</b>	<ul style="list-style-type: none"> <li>• Urban citizens can be used it especially those having busy lifestyle.</li> <li>• Electronic hardware and device market.</li> </ul>
<b>Assumptions and Constraints</b>	<ul style="list-style-type: none"> <li>• New product platform</li> <li>• Electronic imaging technology</li> <li>• Input devices manufactured in Malaysia</li> </ul>

	<ul style="list-style-type: none"> <li>• Output devices manufactured in Malaysia</li> <li>• Image processing engine manufactured in Malaysia.</li> <li>• Mechanism of indoor smart garden system should be tested in Malaysia.</li> </ul>
<b>Stakeholders</b>	<ul style="list-style-type: none"> <li>• Purchasers and users</li> <li>• Manufacturing operations</li> <li>• Service operations</li> <li>• Distributors and resellers</li> </ul>

### 1.3 Objectives

The main objectives of this project are aimed to the problem statement stated:

1. To design a smart garden that are practical and compact features.
2. To develop a smart garden prototype with water-saving watering system and power-saving lighting system features.
3. To implement the smart garden with go green technology concept and very low cost spent.

### 1.4 Scope of Project

This project focuses on the innovation of existing concept, Indoor Organic Smart Garden is suitable for all house use especially for urban citizens. To innovate from existing product, the main challenge is optimising its manufacture cost as compared with the existing product in market. The technology used for this product is fertigation growing plant method. Other than that, this project also will focus in power-saving lighting system and water-saving watering system for its innovation. For this project, automatically lighting system will used, it will automatically light up to the desired wavelength of light on time when the user on the power supply, and plants needed light on that time to carry out photosynthesis. This will increase the

productivity of plants growing (reduce the time to growing, shorter the time to harvest), since plants can carry out photosynthesis process all the time. Besides, smart watering system is automated, same functional like existing product. The enzymes produced is made by the residual of fruits peel or vegetables, so that it will not the unpleasant smell.

This project will cover the design process and development of the indoor smart garden and study of which species of plants that are suitable and recommended for growing indoor and used it by this Indoor Organic Eco-Smart Garden. This project is followed by the detail drawing of indoor smart garden by using Solidworks, process of prototyping the product and the planning to realize it with manufacturing process. A prototype has been planned and discussed, and a cost analysis developed on its basis. Through the analysis of the market potential, different future markets were identified. Furthermore, study of suitable ratio for fertilizer liquid mixer and monitor fertilizer liquid flow also will be covered. Lastly, conclusion and recommendation according to this product are made for further development.

## **1.5 Thesis Structure**

This section is to explain about the overview of the thesis going to be done. In chapter 1, there are background, overview of the project and scope of project which is generally talk about the construction of smart garden. There are also have some problem statement which are going to be solved according to the objectives stated.

Chapter 2 is the literature review of the whole project. In this chapter, there are a lot of student paper, public source and internet source were read and come out with own idea in creating the construction of smart garden.

After studying all the paper and source from the internet, methodology was started which is placed in chapter 3. In chapter 3, there is the flowchart of overall progress and the flowchart of the development of prototype of smart garden. This chapter also has mentioned the steps to construct and create the smart garden design by using design and development method. In this chapter, Quality Function

Deployment (QFD), Morphological Chart, customer need statement and benchmarking to related product have been clearly discussed and stated. The implemented processes, hardware or components to build up in this project will also be specified explained in this chapter.

Chapter 4 is the results and discussion of this project. In this chapter, all the analysis result has been discussed in this chapter. Those analysis results include result of plant growth rate for each different kind of plants, Bills of Material (BOM) and cost analysis result of the smart garden. All the analysis result of smart garden has been recorded and stated in a table and figure, thus it is more easily to understand for other people or student. Generally, chapter 4 is the way how a student analysed the data obtain from the project, so it is importance for the student or people who are going to read.

Lastly, in chapter 5, conclusions and recommendations where be cover in this chapter, all the sustainability, commercialization and future work will be stated in it and the achievement of the objective also will be mentioned to prove the progress is successful or not.

## **CHAPTER 2**

### **LITERATURE REVIEW**

#### **2.0 Overview**

This chapter will discuss on the background of the smart garden, technology used for growing crops in terms of lighting system, irrigation system and planting system, study of each different species of plants in term of fast growing, indoor growing suitability and popularity for Malaysian and competitors. As for the design method, all required information obtained from journals that have been done by other researches previously.

#### **2.1 Background of Smart Garden**

The worldwide projections appear that up to 2040 agrarian arrive can as it were be raised by only another 2% (Banerjee & Adenauer, 2014). Due to population escalating up day by day meanwhile diminishing farm land in the world, producing enough food supply has become one of the serious global issues. According to Emmott, by 2050, the world population will be increase to at least nine billion, at the same time, food demand will speed up at a far faster rate than population growth (Emmott, 2013). One of the issues that people concerned about is nowadays, water also is a scarce resource. From this, this require to minimize the negative ecological impacts of agriculture, especially with respect to greenhouse gas emissions, soil degradation, and the protection of already dwindling water supplies and biodiversity arises. Subsequently, we must attempt to discover some agricultural technologies that have a neutral or positive impact on our environment. Due to climate change, producing crops steadily is a troublesome thing to do. There are many safety concerns for food because
