## DECLARATION

I hereby, declared this report entitled “Consideration of Hand Grip Strength in the Hand Grinder Handle to Improve Subjective Comfort and Work Productivity” is the result of my own research except as cited in references.

Signature : .....  
Author’s Name : CHIN EE LING  
Date : 6 June 2018

## **APPROVAL**

This report is submitted to the Faculty of Manufacturing Engineering of Universiti Teknikal Malaysia Melaka as a partial fulfilment of the requirement for Degree of Manufacturing Engineering (Manufacturing Management) (Hons). The member of the supervisory committee is as follow:

.....  
**(Dr. Isa Bin Halim)**

## ABSTRAK

Pada era globalisasi ini, inovasi peralatan tangan amatlah penting kerana permintaan produk industri pembuatan semakin meningkat. Peralatan tangan perlu direka dengan menerapkan asas ergonomik untuk memastikan pengguna dapat menggunakan peralatan tersebut dengan usaha yang minimum, tetapi boleh menghasilkan keluaran yang maksimum. Dalam industri pembuatan, pencanai tangan merupakan peralatan yang digunakan untuk melaksanakan operasi pemesinan am. Walau bagaimanapun, ramai pengguna menghadapi masalah berkaitan dengan rekabentuk mesin pencanai sedia ada seperti tidak dapat mengenggamnya dengan kemas, saiznya yang besar dan berat, rekabentuk pemegang yang tidak ergonomik, dan terdedah kepada postur pergelangan tangan yang tidak neutral semasa menggunakannya. Hal ini akan mempengaruhi tahap keselesaan dan produktiviti pengguna. Oleh itu, objektif kajian ini adalah untuk mereka bentuk dan membangunkan satu prototaip pemegang pencanai tangan yang dapat meningkatkan keselesaan dan produktiviti pengguna semasa proses mencanai. Untuk mencapai objektif ini, keperluan pengguna telah diutamakan dan diubah suai kepada parameter melalui House of Quality (HoQ). Sementara itu, kaedah saringan telah digunakan untuk memilih konsep pemegang pencanai tangan yang terbaik dan telah dilakar dengan menggunakan perisian SOLIDWORKS. Pemegang pengisar tangan yang selesa telah dihasilkan dengan menggunakan paip PVC. Rekabentuk pemegang pencanai tangan sedia ada dan rekabentuk pemegang pencanai tangan yang dihasilkan melalui kajian ini telah dibandingkan untuk menilai keberkesanannya. Analisa kos telah dilakukan menggunakan kaedah anggaran Return on Investment (ROI). Keputusan kajian ini menggambarkan prototaip pemegang pencanai tangan telah dicipta berjaya meningkatkan tahap keselesaan dan produktiviti pengguna.

## **ABSTRACT**

In the world of globalization, the innovation of hand tools is important due to the increasing of demand in competitive manufacturing environment. Hand tools should be designed ergonomically to ensure users could use the tools with minimum effort to perform maximum operation. In manufacturing industry, a hand grinder is the common tool that used in various fabrication tasks. However, many users faced difficulties such as unable to grip the hand grinder firmly, larger size or weight of hand grinder, inappropriate design of support handle and faced awkward posture in the wrist when overexposure to the existing design of hand grinder handle. It would influence the subjective comfort and work productivity of the user. Therefore, the aim of study is to design and fabricate a high fidelity prototype of hand grinder handle for the improvement of subjective comfort and work productivity during grinding process. In order to achieve the objective, users requirements were translated and modified to technical parameters through House of Quality (HoQ). Meanwhile, concept screening method was applied to select the best concept of hand grinder handle and then sketched with SOLIDWORKS software. A high fidelity prototype of hand grinder handle was fabricated by using the PVC pipe. The existing grinder handle design and proposed handle design developed by this study were compared to evaluate the effectiveness. In order to meet the entrepreneurial requirement, the profitability of the proposed hand grinder was evaluated using Return on Investment (ROI). The result of this study illustrated that a high fidelity prototype of hand grinder handle was able to improve comfort level and work productivity of users.

## **DEDICATION**

Only

my beloved father, Chin Kang Ming

my appreciated mother, Tik Yam Nyap @ Tan Yam Nyap

my adored brother and sister, Chin Yan Ann and Chin Ee Xuan

for giving me moral support, cooperation, encouragement and also understandings

Thank You So Much & Love You All Forever

## **ACKNOWLEDGEMENT**

Firstly, I would like to express my sincere gratitude to my supervisor, Dr. Isa bin Halim. He always provides guidance, advices and critics to me during this project until the project is complete successfully. When I faced difficulties in my project, he had dedicated to provide me useful information and comments for solving the obstacles.

Besides that, I am also grateful and thanks to Dr. Nadiah binti Ahmad and Mr. Nor Akramin bin Mohamad in providing the comments in my project and guiding me to improve my project.

Furthermore, I would like to thank all assistant engineers whose involve in this project. They always give me the supportive information and provide me facilities in completing this study.

Thank and deeply indebted to all my friends whose involve in this project directly and indirectly. They always provide me idea when I am lost.

Lastly, I would like to express my appreciation to my parent who were always gave me moral and financial support in completing this project. They always motivated and advised me to be never giving up easily, thus I manage to complete this project on time.

# **CHAPTER 1**

## **INTRODUCTION**

This chapter presents the background of study, problem statements, objectives, scope, and significant of the study. The background of study is concentrated on the design of hand grinder handle and the work-related injuries due to hand grinder. The problem statements demonstrate the problems that faced from the users in current situation. In the objectives, the target of this study is to design and fabricate a high fidelity prototype of hand grinder handle whereas the scope of study highlights the focus and limitations of the study. At the end of this chapter, significant of study highlights the importance of the study.

### **1.1 Background of Study**

In the world of globalization, the innovation of hand tools is important due to the increasing of demand in competitive manufacturing environment. Hand tools are instruments that have ergonomically designed with unique structure, characteristic and function to ease human work. It is useful in the surface finishing of products such as removing the rough surface or changing the product shape. Due to the simple operation of hand tools, many users can perform their task easily although they have a limited knowledge on that particular hand tool. Hand tools are actually designed ergonomically from time to time to improve the

performance and efficiency of the tool. This is to ensure human could use the tools with minimum effort to perform maximum operation. There are various types of hand tools in the industry, such as hand grinders, hammers, cutters, clamps, saws and hand drills. In manufacturing industry, hand grinder is one of the common tools used in simple tasks.

Hand grinder is a handheld tool that used in the grinding, polishing and cutting processes. It can be either powered by electric motor, petrol engine and compressed air, or used by the battery supplied. During operation, the motor drives at a high speed to turn on the geared head at the right angle. The geared head is fixed with an abrasive disc which can be replaced by a new disc when it is worn after extensive grinding operation. Figure 1.1 shows a hand grinder that normally use for Faculty of Manufacturing Engineering (FKP) in Universiti Teknikal Malaysia Melaka (UTeM). Basically, a hand grinder has 4 main components such as support handle, long arm handle, spindle lock and motor. The hand grinder is designed with a side handle to provide support. Users with right hand or left hand dominant also can use the hand grinder smoothly due to the design of both sides support handle. Although the hand grinder is a multi-purpose tool, it had been reported with various imperfections in recent year.

Figure 1.1: Main components of hand grinder

According to Social Security Organization (SOCSO) of Malaysia, there are 39 cases of accidents associated with electrical hand tools in 2014. Besides, during 1988 to 1992, Swedish

Labour Market Insurances reported that 2830 victims of occupational use of vibrating hand-held tools suffered from permanent medical disabilities (Greenslade & Larsson, 1997). The researchers also declared that the number of permanent debilitate injures in one year caused by these tools is more than half compared to other injuries. Recently, the Occupational Safety and Health Administration of United States Department (OSHA 2017) reported one worker burned in the hand and head when using a hand grinder. This is due to ignition of magnesium chips that produced by the hand grinder.

Apart from the various imperfections of hand grinder, subjective comfort and work productivity will also affected when overexposure to hand grinder. When user exposures to the hand grinder at a long time, their hands will start with a vibration effect and they will feel uncomfortable. At this time, the rough motion will disturb the effectiveness of the user. There was a user make a lamentation about reduction of motion freedom during grinding process (McDowell *et al.*, 2016). This is due to the poor position for the support handle of hand grinder. Therefore, this user was unable to perform well in the grinding process and lead to the reduction of work productivity.

Moreover, many workers who overexposure to hand grinder would easily experience the work-related injuries. The work-related injuries such as Carpal Tunnel Syndrome (CTS) and Raynaud's syndrome (RS) may cause by various factors. These factors could be contributed by human lifestyle, working procedural, working environmental, physiological and socio-economic (Pelmear *et al.*, 1992). Handle design becomes one of the elements that contributed to injuries of CTS. In a previous study, it stated that handle change are being brought due to the sanitation and the increase of motion-related disease such as CTS (Cochran *et al.*, 1985). Figure 1.2 shows a hand that contributed to CTS when holding a handle

### Carpal Tunnel Syndrome

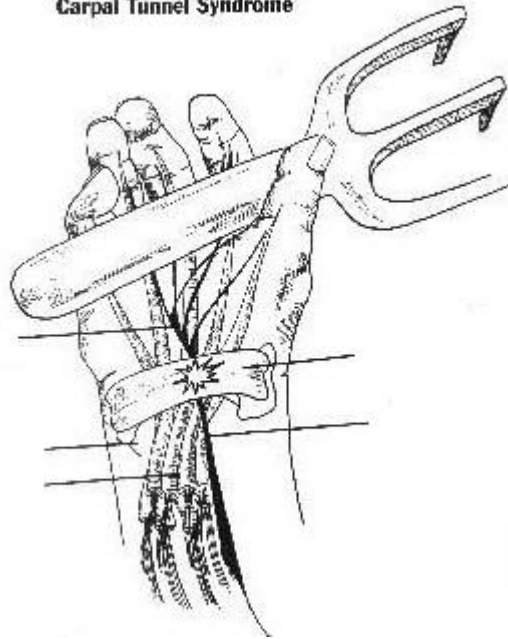

Figure 1.2: Hand with CTS when holding a handle (Master Garden Products, 2014)

Based on the overall considerations, redesign of hand grinder handle is compulsory to achieve future improvement of this hand tool. Many researchers and studies were performed to reduce the exposure of vibration in hand grinding process. However, the effects of handle design parameters such as handle size and shape on Malaysia users remain unexplored. Additionally, the existing hand grinder was designed and manufactured by foreign countries such as Japan and Germany; hence, the anthropometric data applied in the handle design were based on their populations.

To the best of author knowledge, a very few ergonomics studies been conducted to design the handle of hand grinder which considering Malaysian anthropometric data and strength. Therefore the aim of this study is to design and fabricate a handle of hand grinder to increase the comfort level and work productivity in grinding process.

## 1.2 Problem Statements

Muscle fatigue is a condition where an individual is short-term reduction in the capacity to do physical activity (Enoka & Duchateau, 2008). It may be caused by repetitive prolonged use of poor and incompatible design of the product especially the hand tools design. When using the current design of hand grinder handle, workers faced some difficulties such as unable to grip the hand grinder firmly, larger size or weight of hand grinder, inappropriate design of support handle and awkward posture in the wrist.

### a) Unable to grip the hand grinder firmly

The existing design of hand grinder handle is not suitable to be used by female users due to their small palm hand. Most of the female users unable to grip the hand grinder firmly because the design of whole hand grinder is mainly focus to the male users. Figure 1.3 shows a female user unable to grip the hand grinder handle firmly. Eventually, this situation will jeopardize female users from injuries caused by sliding down of hand grinder. Therefore, the female users have high risk to face the accident when using the hand grinder.

Figure 1.3: Hand grinder unable to grip firmly by female's hand

### b) Larger size or weight of hand grinder

Hand grinder is considered as a large and heavy hand tool compare to other hand tool. Due to both characteristics of hand grinder, it can slightly affect the users' performance.
