ABSTRAK

According to the World Health Organization (WHO) report, 300 million people have suffered from asthma throughout the world and the number will amplify to 400 million by 2025. It is determined that the primary reasons of the problem are inappropriate use of inhalers correctly and environmental affair such air pollution and smoking. Hence creating the idea of Development of Inhaler Physiological Monitoring System.

The Inhaler Physiological Monitoring System works when it is turn on by the user. Then the three sensors which are dust, temperature and humidity sensor will take the reading of the patient physiological surrounding every 30 seconds and send the data collected to the node MCU. The data then will process by the node MCU and if the data exceed a certain limit set in the coding the LED will blinking to indicate the area is not suitable for the user. Simultaneously for every 30 seconds, the data will be uploaded to the Internet of Thing cloud which is the Thingspeak application to be recorded.

The development of inhaler physiological system device proved to be useful with the combination of Internet of Thing (IoT) technology. The data that been uploaded can be analyses and at the same time can be use by medical personal or even patient family to monitor the asthma patient therefore the patient. Overall, with the development of inhaler physiological system can make the asthma patient live healthier life and free from asthma disease in the future.

ABSTRACT

Menurut laporan Pertubuhan Kesehatan Sedunia (WHO), 300 juta orang telah menderita asma di seluruh dunia dan jumlahnya akan meningkat menjadi 400 juta pada tahun 2025. Antara punca utama masalah adalah cara penggunaan inhaler yang salah dan masalah alam sekita seperti pencemaran udara dan merokok. Dari permasalahan itu, timbulnya idea untuk menghasilkan 'Development of Inhaler Physiological Monitoring System'.

Projek 'Development of Inhaler Physiological Monitoring System' berfungsi apabila ia dihidupkan oleh pesakit asma. Kemudian tiga alat pengesan iaitu alat pengesan debu, alat pengesan suhu dan kelembapan akan mengambil bacaan fisiologi sekitar pesakit setiap 30 saat dan menghantar data yang dikumpulkan ke 'node MCU'. Data tersebut akan diproses oleh 'node MCU' dan jika data yang diambil melebihi had tertentu, LED akan berkedip untuk menunjukkan kawasan tersebut tidak sesuai bagi pesakit asma. Pada masa yang sama, data akan dimuat naik ke 'Internet of Thing cloud' yang merupakan aplikasi 'Thingspeak' untuk direkod.

Projek 'Development of Inhaler Physiological Monitoring System' terbukti berguna dengan gabungan teknologi Internet Thing (IoT) dimana data yang telah dimuat naik boleh dianalisis dan pada masa yang sama boleh digunakan oleh ahli perubatan atau keluarga pesakit untuk memantau persekitaran pesakit asma. Secara keseluruhannya, projek 'Development of Inhaler Physiological Monitoring System' dapat membantu pesakit asma hidup lebih sihat dan bebas dari penyakit asma di masa depan.

DEDICATION

I dedicate this to my beloved mother and late father, Siti Saodah binti Nawir and
Mohamad bin Mohamad Nasir.

ACKNOWLEDGEMENTS

I would like to express my deepest appreciation to all those who provided me the possibility to complete this report. A special gratitude I give to my final year project supervisor, Mr Ts. Ahmad Fauzan bin Kadmin, whose contribution in stimulating suggestions and encouragement, helped me to coordinate my project especially in writing this report.

Furthermore, I would also like to acknowledge with much appreciation to my friends, Muhammad Fahmi Izzat who help me to assemble the parts and gave suggestion about the designing and constructing my projects. Finally, many thanks go to my family whose have invested their full effort in supporting me in achieving the goal. I must appreciate the guidance given by other supervisor as well as the panels especially in my project presentation that has improved my presentation skills thanks to their comment and advices.

CHAPTER 1

INTRODUCTION

This chapter focuses on the project introduction, background, problem statement, objective, and project scope about this entire project. The development of Inhaler Physiological Monitoring System will be explained briefly in this chapter. Besides that, the motive of this project will additionally be expressed in the problem statement. Furthermore, all the sections that are associated to the theory of this project will be clarified as to indicate the perception of this project.

1.1 Background

According to the World Health Organization (WHO) report, 300 million people have suffered from asthma throughout the world and the number will amplify to 400 million by 2025. It is determined that the primary reasons of the problem are inappropriate use of inhalers correctly and environmental factors such as air pollution and smoking. Generally, children, the elderly and extremely breathless patients are the ones who suffer a lot and in addition with the lack of quick aid, they might also undergo heavy stress. On the other hand, in the hospital, patient and nurse ratio is relatively low therefore the patients were not monitored at all times. Besides that, the adherence of patients to their medication, both in terms of following the doctor's prescription and using the inhaler device correctly, is one of the most vital factors for the effective management of their condition.

Figure 1-1: The correct step to use an inhaler

From there, the idea for development of Inhaler Physiological Monitoring System pop up so that the monitoring patient's condition without nurse help or when the patients are at home can be done. Furthermore, a recent complete assessment of current inhaler devices has underlined important monitoring aspects that are anticipated to enhance the experience of patients with disruptive respiratory diseases and assist them in managing their situation more effectively. Thus, indicating the assessment of inhaler technique as one of the most promising fields for further study.
