Supervisor : SALEHA BINTI MOHAMAD SALEH

ABSTRAK

Projek ini adalah mengenai pembangunan sistem pemantauan untuk pesakit tangan kebas dengan menggunakan analisis elektromilogi yang memerhatikan dan merekodkan proses pemulihan pesakit tangan kebas. Sarung tangan ini direka dengan elemen penginderaan yang dapat mengesan daya yang digunakan untuk setiap pergerakan jari. Unsur penderiaan yang digunakan ialah sensor tekanan dan sensor otot. Sensor tekanan ditempatkan di setiap jari untuk mengesan daya yang digunakan manakala sensor otot elektromilogi (EMG) Myoware diletakkan di otot tangan untuk mengesan aktiviti otot tangan dan analisis isyarat EMG. Protokol PLX-DAQ digunakan untuk menghubungkan dengan Microsoft Excel untuk memantau dan merekodkan proses pemulihan pesakit tangan kebas. Perisian Sketch Up 3D digunakan untuk merekabentuk sarung tangan dan perisian Fritzing Drawing dan perisian Arduino digunakan untuk menguji dan memberi arahan kepada litar sensor tekanan dan sensor otot.

ABSTRACT

This project is about the development of monitoring system for numbness hand patient using electromyography analysis which is to observe and record the recovery process of the numbness hand patient. The glove is designed with sensing element that can detect force applied for every finger movement. The sensing element used are pressure sensor and muscle sensor. Pressure sensor is placed at every fingers to detect the force applied while electromyography (EMG) Myoware muscle sensor is placed at hand muscle to detect the hand muscle activity and analysis the EMG signal. The PLX-DAQ protocol is used to link with Microsoft Excel to monitor and record the recovery process of numbness hand patient. The Sketch Up 3D software is used to design the glove and the Fritzing Drawing software and Arduino software are used to test and give instruction to pressure sensor and muscle sensor circuit.

DEDICATION

To my beloved parents always give support, encouragement and inspiration, I am so grateful for what they have done for me, and I want to express my gratitude in the near future. Without their support, I may not be what I am today.

ACKNOWLEDGEMENTS

I would like to express my deepest gratitude to the distinguished university of the Universiti Teknikal Malaysia Melaka (UTeM). Special thanks to my supervisor, Madam Saleha binti Mohamad Saleh, for her endless guidance, support and encouragement during the preparation of the report. It may not be able to successfully complete my project without her help. Finally, I would like to thank all those who participated directly or indirectly in helping me complete the Final Year Project report.

CHAPTER 1

INTRODUCTION

This chapter discuss about the background of this project. Besides that, problem statement, objective and work scope of this project will also introduce in this chapter.

1.1 Introduction

According to the Oxford English Mini Dictionary, Eighth Edition, numb is meaning as having no sensation of a body part or lacking the power to feel, think, or react[1]. Generally, loss of sensibility in the hands is know as numbness. In view of pressure on the nerves or blood vessels at wrists, arms or fingers usually will cause tingling or burning sensation, sharp pain, or weakness at part of the hands, hence it will have the feeling that numb in hands.

Ann Pietrangelo wrote upon medically reviewed by William A Morrison MD about an unusual prickling feeling that happen in any part of body is called numbness and tingling. Generally, people observe these feeling in hands, feet, legs or arms when sitting with leg crossed or falling asleep on arm for a long time and they do not change position. If numbness or tingling persist and there is no apparent cause of the feeling, it may be a symptom of facing a disease or there is an injury. Paresthesia is a medical term for numbness and tingling [32].

Majority physical therapists recommend a nerve conduction test which also known as electromyography (EMG) to observe the compression of nerve and examine

the extent of nerve damage. Rehabilitate nerve function need to apply physical therapy thus the nerves that compress by bone or other tissue can recover. If the nerve compression left untreated, it can make trouble on hands[4].

Therefore monitoring system will be developed for numbness hand patient using electromyography analysis. A glove with pressure sensor will be designed for sensing the force applied by numbness patient. When numbness patient apply force to the pressure sensor, the pressure sensor will display and save data. EMG will be used when force is applied, muscle sensor will sense electrical activity produced by skeletal muscle and the EMG analysis will be recorded.

Figure 1.1: EMG Analysis [4]

1.2 Background

There was many idea of using EMG for a system and the idea of using EMG is not new. Knapp and Lusted introduced “Biomuse”, which knows as a bioelectric controller for music applications of computer in 1990. The system consists of two components, a bioelectric interface and a signal processing unit. Electrodes and sensors that consist in bioelectric interface are placed on user’s body. Bioelectric interface used to sense the Electromyography (EMG), which is use to sense the body muscle activity,
