DECLARATION

I hereby, declared this report entitled DESIGN AND FABRICATE VEHICLE TRAINER KIT FOR EDUCATIONAL PURPOSE (BODY STRUCTURE) WITH AIDE OF COMPUTER AIDED ANALYSIS is the result of my own research except as cited in references.

Signature :

Author's Name : AMIRUL RIDZUAN BIN FADLI YUSOF

Date : 11th DECEMBER 2019

APPROVAL

This report is submitted to the Faculty of Mechanical and Manufacturing Engineering Technology of Universiti Teknikal Malaysia Melaka (UTeM) as a partial fulfilment of the requirements for the degree of Bachelor of Mechanical Engineering Technology (Automotive) with Honours. The member of the supervisory is as follow:

.....
(TS LUQMAN HAKIM BIN HAMZAH)

ABSTRAK

Tajuk Projek ini adalah ' Reka bentuk dan fabrikasi alatan bantuan pengajar kenderaan(struktur badan)' ramai pelajar yang mengatakan mereka bimbang tentang sistem pendidikan dan juga tentang kekurangan alat latihan yang boleh membantu, ini telah membuatkan mereka merasakan kekurangan latihan praktikal dan ini akan memberi kesan kepada mereka dari segi memahami apa yang mereka telah belajar dalam bilik darjah kerana apa yang mereka telah pelajari tidak dapat dipraktikkan dalam bentuk latihan amali. Ini menjadikan pelajar-pelajar tidak biasa dengan alat-alat serta bahagian-bahagian yang boleh dijumpai di dalam kenderaan yang mereka perlu tahu. Ini mungkin kerana tidak semua latar belakang mereka dari pelajar-pelajar kursus-kursus automotif, mereka adalah graduan daripada pelbagai institusi pendidikan seperti Matrikulasi, Politeknik, STPM dan banyak institusi-institusi lain. Ini adalah mengapa ramai di antara mereka masih tidak sedar bahagian asas kenderaan. Projek ini bertujuan untuk mereka bentuk dan fabrikasi alatan bantuan pengajar kenderaan yang boleh digunakan oleh pelajar untuk meningkatkan kemahiran praktikal. Produk ini akan direkabentuk untuk memenuhi keperluan pelajar dan ini dapat dilakukan dengan pengumpulan data melalui kaji selidik dan selepas data penting telah diperolehi, ia akan digunakan untuk proses Reka bentuk dan ini dibantu dengan menggunakan kaedah pemilihan konsep reka bentuk produk spesifikasi dan juga house of quality. Selepas rekabentuk telah diperolehi selepas melaksanakan pelbagai ujian di SIMSOLID dan juga ujian menggunakan mahasiswa sendiri, rekabentuk akhir dapat dikeluarkan untuk membuktikan bahawa produk yang dikeluarkan memenuhi kriteria dan bahawa ia adalah selamat untuk digunakan untuk pembelajaran.

ABSTRACT

The project's title is ' DESIGN AND FABRICATE VEHICLE TRAINER KIT FOR EDUCATIONAL PURPOSE ' Many of the students who say they are concerned about the education system and also about the lack of training tools that can help, this have made them feel a lack of practical training, and this will affect them in terms of understanding what they have learned in the classroom because what they have learned cannot be practiced in the form of practical training. This made the students unfamiliar with the tools and parts that can be found in a vehicle they should know. This could be because not all of their backgrounds are students from automotive courses, they graduated from various learning institutions such as matriculation, polytechnics, STPM and many other institutions. Therefore, many of them are unaware of the basic parts of the vehicles. The aim of this project is to design and fabricate learning vehicle teaching tools that can be used by students to enhance practical skills. This product will be designed to meet students' needs and this is done with data collection through surveys and after significant data has been obtained, it will be used to process design and this is assisted by using method selection of design concept, product specifications and also the quality house. After the design has been obtained after performing various test types in SIMSOLID and testing using the students themselves, the final design can be produced to prove that the products produced meet the criteria and that it is safe to use for learning.

DEDICATION

This dedication is to my mother Siti Rafeah binti Mat Jah, to my father Fadli Yusof bin Md Tajudin and also to my family. Because of them, this book can be produced, they've been taking care of my upbringing from small until now, that's why I've continued to strive to be successful. This dedication also applies to my supervisor, Ts. Luqman Hakim bin Hamzah and my technical staff Tc. Mohd Syakir bin Mohtarudin because they willingly spend their time teaching and correcting all my wrongdoing to finish this report. And last but not least, to my fellow BMMA cohort 6 who, through this task together, may we pass with flying colour.

ACKNOWLEDGEMENTS

First of all, I would like to express my sincere thanks to my supervisor, Mr Luqman Hakim Bin Hamzah, for giving me the opportunity to participate in this project. Many thanks to him in helping to make this research possible, for his ideas, guidance, support and encouragement, without his help, I will not be able to complete this report. He always gives me ideas on how to overcome many difficulties. I am appreciative and grateful to him for his time in correcting my errors in writing this report. Even though he is busy with class, lab and even family, he willingly spends his time for me. Thanks to my cherished parents, Fadli Yusof and Siti Rafeah that have always supported me from the start of this project and have given me courage. Their support and words have given me strength every time I feel exhausted and this is the reason why I can make this report into reality. My gratitude to all of my friends during the project period for their help and guidance. Lastly, I want to say thank you to all those who involved in this project directly and indirectly. I have gained experience and knowledge from the dedication and sacrifice given to me. This report would have been impossible without them.

CHAPTER 1

INTRODUCTION

1.1. Background of Study

The primary purpose of this project is to produce an educational vehicle trainer kit (body structure) for use by BMMA UTeM students. There are no such trainer kits in any UTeM-owned automotive workshop or laboratory. Trainer kits would be used by students to polish their hands-on skills to another level, this product will help students continue working to empower their hands-on skills. Previously they have to use a real car if they want to do activities such as opening the braking system, this will make it difficult for students in the learning process because they cannot take a closer look at the components they need to know when using the real car.

This is because most of the items masked by many more objects that obstruct their vision, this will suppress the students' learning process when they are unable to fully learn about the components. They only knew components in class during theory lesson without looking at the real things and know their own functions and where the item is placed in the vehicle. Later, most students require vehicle trainer kits like this to help them getting better understanding about the components they have learned in the classroom, this can be proved in Figure 1.1, where 85 (94.4 %) students agreed that they requires a vehicle trainer kit to help them learn the subject of automotive.

Figure 1.1: Students respond to the need of trainer kit

1.2 Problem Statement

A survey was conducted and distributed to 90 participating of BMMA cohort 6 UTeM students. As can be seen in figure 1.2, a total of 29 (32.2 %), 31 (34.4 %) and 18 (20 %) students stated that they did not know the basic car part. This shows that almost all students are not aware of vehicle parts, this percentage remained of concern where students who take the automotive course are not aware of the basic parts of a vehicle. They should be more aware of that condition. This is maybe because students are not exposed to things like this at an earlier stage over the years, which will make it difficult for them to cope with the environment of employment.

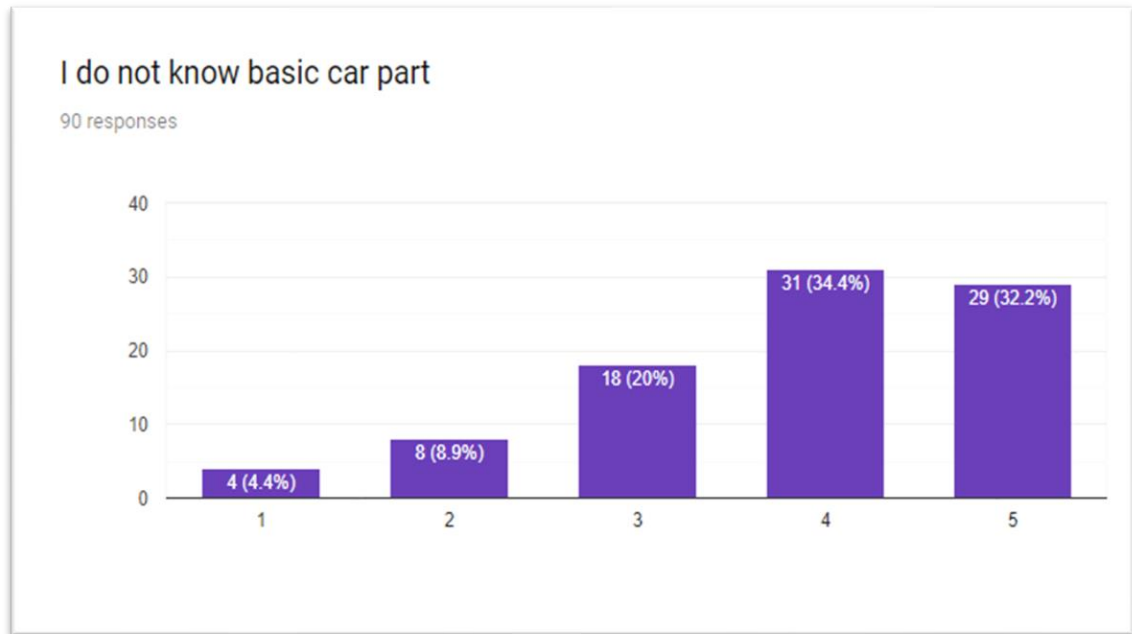

Figure 1.2: Students respond to the knowledge of basic car part

This has deviated from FTKMP's goal of producing highly skilled students in the automotive field, resulting in FTKMP-produced graduates not being accepted at a higher level because they are not highly skilled. So, with this trainer kit, student will be able to polish their hands-on skill thus this will help them in becoming the highly skilled students and labor.

1.3 Project Objective

The main purpose of this project is to produce a vehicle trainer kit for educational purposes that can be used by students to improve their hands-on skills. It will enhance their knowledge of how to do a variety of processes such as changing the brake system and many more. Then, to exposed student to the actual part so they can see and learn about it. Lastly is to design the best structure for the seat base that can bear the load that will be given.

1.4 Project Scope

There is a few limitation or project scope for this project. The first scope is that this project product is limit or focus mainly to BMMA students, this product purpose is to improve the hands-on skill that the BMMA students already have and to create the hands-on skill if their does not have it. Second is, the learning element that will be implant in this project product such as the braking system and suspension system. Lastly is the seat base area structure design, the reason this is the only area that will be focus in this project is because there is not enough time to study the other variable upon this project product.

CHAPTER 2

LITERATURE REVIEW

2.1. Skilled Labor

Person, who is specialized know-how, has enough training and experience to accomplish more-complicated physical or mental tasks than routine job functions. That is the definition for skilled labour or worker. Skilled labour usually or commonly related to person who has higher educational background, have high level expertise that has be attained through various training and a long time experience, and higher wages (Unnes, 2010). A skilled labour usually has these all three criteria but sometime, even some who lack on one of it can be call as skilled labour. Someone who does not have higher educational background can make it up by attained a lot of experience, they usually stand out more than person who has higher educational background.

The demand for skilled labour in all kind of work sector is highly ascending all across the world. This is due to the side effect for the uprising in the technology industrial. Each country is racing to get their hand on skilled labour especially countries in Asia. Meantime, rather than depending on hired skilled labour worker from overseas, big and advance country like U.S. and Western European, which have monopolized economic growth since the mid-1800s, they are paying more attention to preservation and growth of their skilled labour workforce. Their focus in making they own skilled labour by doing various training program extensively for both new and existing employees in order to increase the rate of the skilled labour (Unnes, 2010).

2.1.1. Skilled Labours in Malaysia

Now the world has already entered the era of the industrial revolution 4.0, this is an era where it is closely linked to the importance of information and data to humans in the future and to ensure that industrial players are not left behind in this matter, they should always be sensitive to the cyber physical system, this system should involve in new capabilities with technology that should be up-to-date. The industrial revolution 4.0 requires technology and larger production scale, this indirectly have impact to the Malaysia industry. All of this would not be likely to happen if it is not powered by the energy of highly skilled labour, they are needed especially in important and complexes assignments, such as developing systems, applications and services such as artificial intelligence and analyse large data (Kamarudin, 2019).

To qualify a country and industry community to be recognised as cyber-physical systems successfully implemented, this stage should be fully carried out. Malaysia is still far behind in aspect of the provision of skilled workforce to face the fourth industrial revolution, this is because still too many industries in Malaysia that puts the dependence on employment manual that require human energy. The lack of effort in developing its own technologies in line with the requirements of the relevant industry has caused Malaysia to put the dependence on foreign technology to help in the efforts to solve these problems (Kamarudin, 2019).

Malaysia was also not spared from the need at skilled labour, as a country that is rapidly developing economically, Malaysia requires a skilled labour. A skilled workforce propagates national excellence is a must, in order to fulfil in becoming a developed nation by 2020, focusing in to build human capital that can help the country achieve its goal is the new government agenda (NST, 2018). Malaysian government aim to create 1.5 million jobs by the year of 2020, 60 per cent from it is the jobs that will be require person who is excel in Technical and Vocational Education and Training (TVET) qualifications. TVET is a vital platform to increase the number of skilled workers in the country. Malaysia are

targeting a 35 per cent skilled workforce by 2020. In fact, it has been anticipate that by 2023, three million jobs will require skilled workers (NST, 2018).

The Malaysian economy need a booster in order to grow continuously in the long term, and skilled labour is one of the best and effective way that what Malaysian need in order to boost its economy, better proportion of skilled labour will move up value chain and be globally competitive. What it means by move up value chain is that higher value of producing goods and services, this means that productivity will surely rise. This will eventually help worker getting better wages and that is the basic on how human capital can help the economy according to the argument of policymakers when they speak on economy improvement.

So basically, to attract large capital investment, Malaysian needs more skilled labour then they do now in order to achieve that goal before or on 2020 (Saieed, 2016). Overly dependent on foreign workers who are not skilled and cheap, lack of creativity and innovation in labour productivity growth is weak, and the lack of skilled workforce make Malaysia far behind in terms of standards for standards of high income countries (Saieed, 2016). To become a country that be the focus of in terms of investment, Malaysia should be able to go through or managed to meet the industrial revolution era 4.0, this will surely attract investors from foreign countries to invest in Malaysia because of the energy-sufficient skilled manpower. Products that are produced for export to other countries will be able to be increased and this will help in the process of technology transfer in Malaysia (Kamarudin, 2019).

2.1.2. Skill Labor in Automotive Sector

Malaysia's automotive sector has increase in the past few years, and it has proven itself to be one of Malaysia's key industries that help in the growth of gross domestic product, to be specific, automotive sector have contributing as much as 4.2 per cent to the total of it (Ariffin, 2019). as we can see in figure 2.1, Malaysian
