

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

**DEVELOPMENT OF POWER FACTOR AND
CAPACITOR VALUE MEASUREMENT**

This report is submitted in accordance with the requirement of the Universiti Teknikal Malaysia Melaka (UTeM) for the Bachelor of Electrical Engineering Technology (industrial power) with Honours.

BORANG PENGESAHAN STATUS LAPORAN PROJEK SARJANA MUDA

Tajuk: DEVELOPMENT OF POWER FACTOR AND CAPACITOR VALUE
MEASUREMENT

Sesi Pengajian: 2019

Saya **MUHAMMAD IRFAN BIN AMRAN** mengaku membenarkan Laporan PSM ini disimpan di Perpustakaan Universiti Teknikal Malaysia Melaka (UTeM) dengan syarat-syarat kegunaan seperti berikut:

1. Laporan PSM adalah hak milik Universiti Teknikal Malaysia Melaka dan penulis.
2. Perpustakaan Universiti Teknikal Malaysia Melaka dibenarkan membuat salinan untuk tujuan pengajian sahaja dengan izin penulis.
3. Perpustakaan dibenarkan membuat salinan laporan PSM ini sebagai bahan pertukaran antara institusi pengajian tinggi.
4. **Sila tandakan (X)

SULIT* Mengandungi maklumat yang berdarjah keselamatan atau kepentingan Malaysia sebagaimana yang termaktub dalam AKTA RAHSIA RASMI 1972.

TERHAD* Mengandungi maklumat TERHAD yang telah ditentukan oleh organisasi/badan di mana penyelidikan dijalankan.

TIDAK TERHAD

Yang benar,

Disahkan oleh penyelia:

*Jika Laporan PSM ini SULIT atau TERHAD, sila lampirkan surat daripada pihak berkuasa/organisasi berkenaan dengan menyatakan sekali sebab dan tempoh laporan PSM ini

DECLARATION

I hereby, declared this report entitled DEVELOPMENT OF POWER FACTOR AND CAPACITOR VALUE MEASUREMENT is the results of my own research except as cited in references.

Signature:

Author : MUHAMMAD IRFAN BIN AMRAN

Date:

APPROVAL

This report is submitted to the Faculty of Mechanical and Manufacturing Engineering Technology of Universiti Teknikal Malaysia Melaka (UTeM) as a partial fulfilment of the requirements for the degree of Bachelor of Electrical Engineering Technology (industrial power) with Honours. The member of the supervisory is as follow:

Signature:

Supervisor : EN. AZHAN AB RAHMAN

Signature:

Co-supervisor: EN. AZHAN AB RAHMAN

ABSTRAK

Laporan ini ditulis bertujuan untuk mengurangkan caj tambahan yang akan dikenakan sekiranya nilai faktor kuasa dibawah 0.85. Hal ini juga melibatkan jangka masa keupayaan peralatan elektrik untuk bertahan sekiranya nilai faktor kuasa tidak didalam jarak antara 0.85 sehingga 1. Selain itu juga, nilai faktor kuasa yang tidak mencapai had piawai akan menyebabkan wayar yang bersambung kepada beban akan kepanasan. Hal ini akan menyebabkan berlakunya litar pintas dan kebakaran akan berlaku. Seterusnya, nilai faktor kuasa yang tidak mencapai piawai menyebabkan sesebuah kilang atau bangunan yg mempunyai beban seperti motor aruhan akan memerlukan kuasa yang banyak dan menyebabkan bil elektrik akan meningkat serta tidak efisien. Projek yang akan dibina ini dapat membantu memaparkan nilai kapasitor yang perlu digunakan untuk membaiki faktor kuasa berdasarkan nilai bacaan arus dan voltan. Pengiraan ini akan dilakukan oleh Arduino UNO yang telah di progamkan terlebih dahulu dan memaparkan nilai kapasitor pada LCD.

ABSTRACT

This report is written to reduce the additional charge that will be incurred if the power factor value is below 0.85. This also involves the duration of electrical equipment to survive if the power factor value is not within the range of 0.85 to 1. Additionally, the power factor values that do not reach the standard limit will cause the wires connected to the load to be overheated. This will cause short circuit and fire will occur. Furthermore, the value of non-standard power factor causes a factory or building that has a load like induction motor will require a lot of power and will cause the electricity bill to rise and not efficiently. This project will help display the capacitor values that need to be used to repair power factor based on the value of current and voltage readings. This calculation will be performed by Arduino UNO which has been pre-emitted and displays the capacitor value on the LCD.

DEDICATION

This report is intended to reward my family and my mother and father Amran bin Abdullah and Noor Hayati binti Mohamed for all the support and motivation and advice and ringgit devoted to me to complete and produce these reports and projects. do not forget to my supervisor En.Azhan Ab Rahman who helped, supported, and devoted his knowledge and ideas to completing this report and project. Otherwise, I would like to thank fellow friends who assist in solving technical problems during the process of completing this project. Finally, without them I can not finish the project successfully and perfectly.

ACKNOWLEDGEMENTS

I would like to thank Mr. Azhan Ab Rahman for his support in terms of his support in carrying out these reports and projects. besides that he also gave good advice and ideas to be done for the purpose of improving from all aspects. I also forgot my parents in providing support and enthusiasm in facing the challenge of completing this final project for the university. I appreciate the efforts and cooperation of all the parties involved and help me to do the tasks beyond my ability and it is a challenge and responsibility.

CHAPTER 1

INTRODUCTION

1.1 Background

The meaning of power factor is ratio between of the true power(kW) to the total power(kVA) consumed by anything use the a.c electrical equipment or anything of complete electrical installation. This is a measurement ration of how the efficiently the work output when electrical electrical output is converted to useful energy power. The perfect and ideal power factor value is one or unity but if anything less than that means the power supply need extra power to consume the equipment to achieve one or unity or nearest of these.

The power supply and distribution system cause losses in all the current flow. The most efficient loading of the supply is when a load with a power factor of one. When the load makes the power factor of 0.8, will makes the the consumer get the higher loses in the supply system and also make bill increased. In other term, when make even small improvement in power factor able to make reduction in power losses.

The reative power also known as ‘missing power’ when the power factor is less than one. By the way, to perform the desire fuction, magnetism field is needed by the the operation of motors and also others inductive loads. Wattless, magnetising or wasted power also known as reactive power.

A poor power factor normally based on the significant phase angle different between the voltage and current at terminal load or also can be by the harmonic of the current waveform. Another cause of poor power factor is usually by the inductive load such as an induction motor, a ballast in the luminair, a power transformer, a welding set, a home heater,
