

RAILWAY VEHICLE MAINTENANCE – TRANSFORMER OILS’ ANALYSIS

MEGAT MUHAMMAD HAZIQ BIN OTHMAN

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

RAILWAY VEHICLE MAINTENANCE: TRANSFORMER OILS' ANALYSIS

MEGAT MUHAMMAD HAZIQ BIN OTHMAN

**A report submitted
in fulfillment of the requirements for the degree of
Bachelor of Mechanical Engineering**

Faculty of Mechanical Engineering

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

SEPTEMBER 2020

DECLARATION

I declare this project entitled "Railway Vehicle Maintenance: Transformer Oils' Analysis" is the result of my own work except as cited in the reference.

Signature :.....

Name : Megat Muhammad Haziq Bin Othman

Date :.....

APPROVAL

I hereby declare that I have read this project report and in my opinion this report is sufficient in terms of scope and quality for the award of the degree of Bachelor of Mechanical Engineering.

Signature :

Supervisor Name : Professor Madya Ir. Dr. Mohd Azman Bin Abdullah

Date :

DEDICATION

This report is dedicated to my parents, Othman Bin Mohd and Raja Haidah Binti Raja Ali for their ongoing support and love of finishing this project report for the final year. In addition, they also taught me to believe in Allah in whatever condition we had, especially during the completion of this report. In addition, also to my family, who always support me with unconditional love, which motivates me to set a higher goal to complete this final year project. Next I devote this study to my supervisor Professor Madya Ir. Dr. Mohd Azman Bin Abdullah, since that gives me the ability to choose this project. Apart from that, he also gives me inspiration, coaching and encouragement to explain my final year project. Always dedicated to my beloved friends, this devotion has provided me with a powerful shield of love and always protects me and never allows any sorrow to enter.

Thank you

ABSTRACT

Rolling stock or train is one of the primary transportation in most of the country especially in Malaysia. Therefore, maintenance is needed for train in order to make sure that it can run smoothly without any failure occurred. The purpose of this study are to analyze the railway vehicle transformer, to analyze the transformer oil in the sampling duration is beyond the reference point or not and to make the recommendations for maintenance strategy if any error occurred in the oil sampling result. The research only focus on train transformer oil in the duration of five years. There were seven rolling stock are analyzed. Overall data for oil sampling in past five years were gain from the ERL Maintenance Support Sdn. Bhd, Sepang for all aspects that have been analyzed. The analysis consists of four main aspects which are dielectric strength, water content, acid number and interfacial tension and stated also the date of oil sampling. Next, the data gain is presented and analyzed by using bar graph so it will more easy to analyzed and present the data. Finally, the most critical maintenance issues can be analyzed using the bar graph.

ABSTRAK

Kereta api merupakan salah satu kemudahan pengangkutan dalam kebanyakan negara terutama Malaysia. Oleh itu, penyelenggaraan adalah diperlukan untuk kereta api untuk memastikan ia dapat berfungsi dengan baiknya tanpa berlaku apa-apa masalah yang tidak diingini. Tujuan pembelajaran ini dibuat adalah untuk kenal pasti jenis pengubah yang digunakan pada kereta api, kenal pasti samada minyak pengubah melebihi nilai rujukan ataupun tidak di dalam tempoh jangka masa pengambilan minyak dan membuat cadangan untuk strategi penyelenggaraan sekiranya berlaku apa-apa kegagalan yang berlaku terhadap minyak. Terdapat empat aspek kereta api telah dianalisa. Keseluruhan data untuk pengambilan minyak selama lima tahun lepas diperolehi daripada ERL Maintenance Support Sdn. Bhd, Sepang. Analisa terhadap minyak terbahagi kepada empat aspek utama iaitu kekuatan dielektrik, kandungan air, nombor acid dan ketegangan antara muka, di samping itu tarikh pengambilan minyak juga dicatat. Kemudian, nilai yang diperolehi telah dibentangkan dan dianalisa menggunakan graf bar supaya ia senang untuk dianalisa dan membentangkan data tersebut. Akhir sekali, isu penyelenggaraan boleh dianalisa menggunakan graf bar.

ACKNOWLEDGMENT

First of all, I wish to honor and thank the Almighty God for His blessings during my research work in order to successfully complete the report. I would like to thank those who have been involved during completing this Final Year Project (FYP) whether it is directly or indirectly. This FYP cannot be completed and produced with the help of others.

Next, I would like to express my special thanks of gratitude to my supervisor Professor Madya Ir. Dr. Mohd Azman Abdullah that gave me guidance because he gave me golden opportunities to do this wonderful project on the title 'Railway Vehicle Maintenance: Transformer Oils' Analysis'. With his professional views and valuable opinions have helped me to make appropriate solutions on problems that encountered during the critical stages that I had. With his patience, motivation, enthusiasm and immense knowledge also helped me a lot during completing this Final Year Project report.

Finally, a lot of thanks also for my beloved parents and family because they advise and motivate me from time to time in making this project, although they are quite busy with their duties, they always give me opinion in making this report interesting.

CHAPTER 1

INTRODUCTION

1.1 Background of Study

Railway vehicle is one of the pioneers of modern mechanical transportation around the world including Malaysia. The movement of the railway vehicle is using track and monitored by the railway maintenance workers to make sure that all the moves are smooth. In Malaysia, the railway transport is owned by the Malaysian government and is operated by the Keretapi Tanah Melayu Berhad (KTMB). Therefore, the railway played its significant role in the economic, social and political development. It also can reduce traffic congestion and not wasting time in traffic jams. In Malaysia have several types of railway vehicle such as KTM, Light-Rail Transit (LRT), Mass Rapid Transit (MRT) and Electric Train Service.

Next, maintenance is one of the important parts to make sure that the railway vehicle is in good condition and can reduce the operating cost for transportation companies. Therefore, the preventive maintenance scheduling is very important in maintaining the reliability for the railway vehicle maintenance. The aim is focusing on the medium-term planning, to identify the preventive maintenance that will be performed within the periods (month/week/hours) that have been scheduled (Budai et al., 2006). Moreover, this preventive maintenance can be divided into small routine works and projects that consist of inspection and repairs for example inspection of rails, level crossing, switch, signaling system and switch lubricating.

Besides that, the transformer also important for all railway vehicle, and it is located below the railway vehicles. The transformer is used to transfer electric power from the catenary to the motor by lowering the network's high voltage to low voltage for use by the converters (Ho et al., 2006). For the transformer oil, it has several types of oil are used as insulators such as mineral, ester and silicon oils. The insulator is very important to maintain the reliability of the transformer because its function as a conductor for the electricity. Therefore, the insulating liquids contain their own dielectric constant, particle counts and viscosity reading. On the other hand, it is important to do preventive maintenance for the insulating liquid to get the best performance transformer.

1.2 Problem Statement

Power transformers are one of the most costly and critical electrical power system components (Murugan & Ramasamy, 2019). A better maintenance planning allows for higher utilization of railway infrastructure and improved services and customer quality (Shift2Rail, 2015). According to D'Ariano et al. (2017) during the growing demand for railway transportation, the safety, punctuality, reliability of the freight and passenger service are important. Therefore, the scheduling maintenance or Preventive Maintenance (PM) will increase the availability of rail transportation and also reduce the maintenance cost during the breakdown. The study of the transformer oil analysis issues for the railway vehicle can improve the performance of the railway vehicle because the transformer oil is one of the important liquid functions as an insulator.

1.3 Objectives

This study has three main objectives that must be accomplished in order to complete the study. The first objective is to analyze the railway vehicle transformer oil. Second objective is to study the trend for the transformer oil. Lastly, the third objective is to make the recommendations for transformer oil whether the oil still can be used, need to replace or need to filter.

1.4 Scopes of study

To achieve this aims of the research, the study has been done in local commuter rail transit company. This study is focusing on the railway transformer oil analysis between the new and used oil. Then, it focused on general transformer oil analysis which investigate the different between general transformer and railway transformer. Lastly to achieve this aims, comparison between the used transformer oil and new transformer oil is needed to investigate the reliability of the oil.
