ABSTRACT

Nowadays, attendance management of students using the conventional methods had been a challenge to a lecturers or teachers especially with a large number of students. It is not only a time-consuming task, but it can be a burden to the lecturers or teachers. Besides, due to the large number of students, there is always a possibility of proxies and fake attendance. Hence, several automated attendance systems are using biometric verification have been proposed. Facial recognition technology is one of the biometric methods and is widely used in the attendance management system. By using the facial recognition technique, issues such as proxies and fake attendance can be avoided and most importantly is timesaving. However, previously proposed systems have some drawbacks such as lightning of the images, noise from the camera, and the angle of student face that made the attendance management ineffective and inefficient. Therefore, this paper proposes high speed and accurate attendance management using facial recognition techniques. In this paper, Raspberry Pi 4, Pi camera and dlib's algorithm are utilized as a microcontroller, camera and algorithm for facial recognition, respectively. During the attendance taking session, student's face that captured by the camera is identified in the database. Once it has been identified, student's attendance is recorded in the system. Then, an email is sent to student's parent as a notification for their attendance in class. From the experimental results, the captured student's face is successfully recognized, and attendance is successfully recorded in the system. Besides, time taken for parents received a notification email once attendance is recorded is about 3.8s if a total student in class is 30 students.

ABSTRAK

Pada masa kini, pengurusan kehadiran pelajar menggunakan kaedah lama telah menjadi satu cabaran kepada pensyarah atau guru terutamanya dengan sebilangan besar pelajar. Ia bukan sahaja satu tugas memakan masa, tetapi ia boleh jadi satu beban kepada pensyarah atau guru. Selain itu, disebabkan bilangan pelajar yang ramai, sentiasa ada satu kemungkinan proksi dan kehadiran palsu. Maka, beberapa sistem kehadiran automatik menggunakan pengesahan biometrik telah dicadangkan. Teknologi pengenalpastian wajah ialah salah satu kaedah-kaedah biometrik dan digunakan dengan meluas dalam sistem pengurusan kehadiran. Dengan menggunakan teknik pengenalpastian wajah, isu seperti proksi dan kehadiran palsu dapat dielak dan yang lebih penting ialah jimat masa. Bagaimanapun, sistem yang dicadangkan sebelum ini mempunyai sedikit kelemahan seperti pencahayaan imej, gangguan bunyi dari kamera, dan sudut muka pelajar yang membuat pengurusan kehadiran tidak berkesan dan tidak cekap. Lantaran itu, kertas ini mencadangkan kelajuan yang tinggi dan pengurusan kehadiran yang tepat menggunakan teknik-teknik pengenalpastian wajah. Dalam kertas ini, Raspberry Pi 4, Pi kamera dan algoritma dlib digunakan sebagai satu mikropengawal, kamera dan algoritma untuk pengenalpastian wajah, masing-masing. Semasa mengambil sesi kehadiran, wajah pelajar yang ditangkap oleh kamera dikenalpasti dalam pangkalan data. Sebaik sahaja ia telah dikenalpasti, kehadiran pelajar direkodkan dalam sistem. Kemudian, satu emel dihantar ke penjaga pelajar sebagai satu pemberitahuan untuk kehadiran mereka dalam kelas. Dari hasil percubaan, muka pelajar ditangkap dan berjaya dikenalpasti, dan kehadiran dengan berjaya direkodkan dalam sistem. Selain itu, masa yang diambil untuk penjaga menerima emel pemberitahuan sebaik sahaja kehadiran direkodkan lebih kurang 3.8s jika keseluruhan pelajar dalam kelas ialah 30 orang pelajar.

ACKNOWLEDGEMENTS

By the Name of ALLAH S.W.T, the Most Gracious and the Most Merciful

First of all, with this opportunity thank to ALLAH S.W.T for this Almighty that makes me healthy throughout completing this report paper. I also take this opportunity to all who have contributed their help and give me support in completing this report paper. Without whose cooperation, encouragement and suggestion, this report paper would not have been possible.

I would like to thank my supervisor Dr. Fara Ashikin Binti Ali and my co-supervisor Dr. Norhashimah Binti Mohd Saad, who gives me full support, courage, advices and knowledge. Million thanks for his and her knowledgeable supervision. With guidance, view and suggestions from his and her throughout this report paper, I able to complete this report paper. All him and her effort in my study are much appreciated.

Very special thanks to my beloved family who sacrifice much and supported us efforts with love, understanding and constant encouragements without which it not has been possible for me to earn this Bachelor of Computer Engineering Technology (Computer Systems) with Honours. Thanks for their never-ending support.

Lastly, I would like to dedicate my sincere gratitude and appreciation to friends around me for their assistance and support throughout the duration of we graduate studies. Once again, thanks to all who have contributed in completing this report study.

CHAPTER 1

INTRODUCTION

1.1 Background

The Smart Class Attendance System by using facial recognition proposed is developed based on the Internet of Things (IoT). IoT describes as a network of physical object which is mainly concerned with the variety of devices being interconnected solely within the existing infrastructure being shared between them. It can be seen as a nervous system that binds everything together and can be achieved by performing simulations and processors integrated with physical objects to retrieve information in real-time. Collected data will be analyzed where smart decisions are taken by computers without human interference, whether to overcome the real problem or to improve the existing situation. In simple, IoT improves several existing systems to make them more efficient and intelligent.

Nowadays, the facial recognition technique is conventional, owing to its efficiency and impressive showing. A lot of enhancement has been made in previous few years resulting the system is widely used for industrial and security purpose. Similarly, the facial recognition technique can be applied to the school or higher institutions to track the presence of students in class. Hence, a facial recognition attendance system will serve as a solution to the challenge and add great heights of simplicity for tracking student's attendance. In spite of, manual entry of attendance in attendance's list that consumed a lot of time, face detection and recognition algorithm mechanically detect the students and

manage the attendance is more efficient. Throughout the enrolling of a students, the students' needs to train by taking multiple images of a student's alongside his/her id and name conjointly. The appearance of each student will be uploaded into the database, and the lecturers can track their attendance on the webpage. Therefore, this method provides accurate and detailed results in an interactive way to the user instead of conventional attendance systems.

1.2 Problem statement

The conventional student attendance system commonly faces many problems such as accuracy of data collected, time-consuming and no backup or memory to record attendance. According to the conventional attendance system, the most crucial issue is the accuracy of the data collected. This can be as a result of the attendance sheet is passed around the class during the lecture sessions which leads to a fake and proxy attendance. On the other hand, the conventional attendance system is time consuming. Considering there is a huge number of students present in a lecture hall and the time required for a student to sign his or her attendance on a two to three pages list of names is approximately 30 seconds, in half an hour, only about 60 students can sign the attendance. This matter will disrupt the learning process and causes students to be distracted.

Besides that, there is no backup or memory to record the attendance once the lecturer had lost the hardcopy of attendance list. For example, around the whole of the semester, the lecturer will only collect and validate the attendance of students based on a sheet of paper. So, before the end of the semester that attendance is important to be uploaded in the institutional system by a lecturer to produce a report. However, if the

lecturer had lost the attendance sheet means all the record of student attendance will be lost and can cause some trouble to enter correct data of the whole semester. Moreover, it may cause waste of paper since lecturers have to reprint the attendance sheet multiple times due to several causes such as additional of new students, students drop, or attendance lost.

Thus, this system attendance by using facial recognition is proposed to replace the conventional attendance of the presence of students who are troublesome and affect students to be distracted to take part in each other's attendance. As a result, the previous system needs to be developed to improve effectiveness, data integrity, and make information accessible with those legitimate parties.

1.3 Project objectives

The objectives of this project are as follow:

1. To study the features of an algorithm with a low-cost system to recognize the identified student by using facial recognition technique.
2. To develop a smart class attendance based on facial recognition technique using Raspberry Pi.
3. To evaluate the functionality and the effectiveness of the system.

1.4 Project scopes

The scopes of this project are as follow:

1. Investigation on possible methods and solutions for the attendance management system to the students and staff of an institution.
