BORANG PENGESAHAN STATUS LAPORAN
PROJEK SARJANA MUDA II

Tajuk Projek : DEVELOPMENT OF SMART BODY TEMPERATURE RECORDING SYSTEM
USING RFID TAG

Sesi Pengajian : 2022/2023

Saya MUHAMMAD HAZIM BIN MAZLAN mengaku membenarkan laporan Projek Sarjana

Muda ini disimpan di Perpustakaan dengan syarat-syarat kegunaan seperti berikut:

1. Laporan adalah hakmilik Universiti Teknikal Malaysia Melaka.
2. Perpustakaan dibenarkan membuat salinan untuk tujuan pengajian sahaja.
3. Perpustakaan dibenarkan membuat salinan laporan ini sebagai bahan pertukaran antara institusi pengajian tinggi.
4. Sila tandakan (✓):

SULIT*

(Mengandungi maklumat yang berdarjah keselamatan atau kepentingan Malaysia seperti yang termaktub di dalam AKTA RAHSIA RASMI 1972)

TERHAD*

(Mengandungi maklumat terhad yang telah ditentukan oleh organisasi/badan di mana penyelidikan dijangkakan)

TIDAK TERHAD

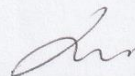

Disahkan oleh:

(TANDATANGAN PENULIS)

Alamat Tetap:

No.1, Jalan Meranti 2C/3,
Bandar Baru Batang Kali,
44800 Batang Kali,
Selangor.

DECLARATION

I declare that this project report entitled “Development of Smart Body Temperature Recording System Using RFID Tag” is the result of my own research except as cited in the references. The project report has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.

DEDICATION

I would like to dedicate this piece of work to my beloved parents and family, as they helped me in my time of woe and distress. They instilled in me the sense to learn and the willpower to push through and to never give up. Also, not to mention a thousand gratitude to my supervisor and friends for supporting me throughout the development of this project

ABSTRACT

This project is aimed towards employees and workers to access their company vicinity using the RFID tags while also having their temperature measured by the infrared thermometer. Basically, if there is an anomaly or an elevated reading of temperature (Symptom of Covid-19) then access for that specific employee would be denied. Also, the data received would be admitted towards the website of the company that monitor the time schedule and employee's temperature. Since the outbreak of Covid-19, premises had implemented the use of temperature checker to detect their employees' temperature for safety measure. However, this method provides temporary adjustment as it could only perform crudely given its basic function. In addition, this method lacks the ability to record and alert the premises of the employees' health. Hence, an improvement is long overdue given the circumstances. Therefore, a more thorough system is needed to further enhance the system for a better work safe environment.

ABSTRAK

Projek ini bertujuan untuk pekerja dan pekerja mengakses kawasan sekitar syarikat mereka menggunakan tag RFID sambil juga mengukur suhu mereka dengan termometer inframerah. Pada asasnya, jika terdapat anomali atau bacaan suhu yang tinggi (Gejala Covid-19) maka akses untuk pekerja tertentu itu akan dinafikan. Selain itu, data yang diterima akan diterima masuk ke laman web syarikat yang memantau jadual waktu dan suhu pekerja. Sejak penularan wabak Covid-19, premis telah melaksanakan penggunaan pemeriksa suhu untuk mengesan suhu pekerja mereka untuk langkah keselamatan. Walau bagaimanapun, kaedah ini menyediakan pelarasan sementara kerana ia hanya boleh berfungsi secara kasar berdasarkan fungsi asasnya. Di samping itu, kaedah ini tidak mempunyai keupayaan untuk merekod dan memaklumkan premis kesihatan pekerja. Oleh itu, penambahbaikan sudah lama tertangguh berdasarkan keadaan. Oleh itu, sistem yang lebih teliti diperlukan untuk mempertingkatkan lagi sistem untuk persekitaran selamat bekerja yang lebih baik.

ACKNOWLEDGEMENT

First and foremost, all praise to ALLAH S.W.T for His blessing in giving me the chance to accomplish this work.

I would like to express my sincere gratitude to Ma Tien Choon, my beloved supervisor, for all his encouragement, guidance, inspiration, suggestions, and assistance throughout my project, Development of Smart Body Temperature Recording System Using RFID Tag, which is part of my Final Year Project (FYP). He also shared all his experiences and professional knowledge with me and provided the best guidance for me to successfully complete my project. Throughout my bachelor's degree studies, he has kept me motivated and provided me with advice on improving my research skills to finish this work.

I'd also like to thank the Faculty of Electrical and Electronic Engineering (FTKEE) for offering a complete thesis template with methodical methods, Technologist Doctor Rostam Affendi Bin Hamzah, Technologist Ahmad Fairuz Bin Muhammad Amin and members of my panels for both Seminar I and Seminar II, for their constructive remarks and evaluations, and all lecturers for their support, encouragement, and assistance along the road.

Thousand gratitude to my friends and colleagues, Muhammad Syafiq Bin Yaakob, Muhammad Hilmi Bin Zakaria and Muhammad Hisham Bin Ahmad Asri, Muhammad Luqman Bin Jamal Abd Nasir, Muhammad Firhad Bin Abu Bakar who assisted and supported me along the way.

I am grateful to the Universiti Teknikal Malaysia Melaka (UTeM) for allowing me to pursue my interest in engineering field studies while also allowing me to provide some things for the university's future reference.

CHAPTER 1

INTRODUCTION

This chapter will study about the background of the project, problem statement, objectives, scope of the project and the project outline.

1.0 Background

As of late, the Novel Coronavirus or COVID-19 pandemic has been one of the major global issues felled upon most countries worldwide. Infecting a large sum of populations in such a short period of time. It is of concern that temperature and humidity variations anonymously became an important topic since symptoms of COVID-19 include heightened body temperature and fever. Precautions have been made and applied such as the use of face masks, sanitizers, social distancing, commence of SOP (Standard Operating Procedure) and many more. However, one such precautions that proved to be vital in the effort to stop the spreading is the need to scan body temperature before entering a publishment or building. Undoubtedly, in most situations, guards would have been posted and stationed to hinder infected person from entering the compound. This setting would have been ideal to open places but is not to narrow and close places. Hence, this paper will focus on an IoT based system that effectively monitor body temperature using sensors and IoT based technologies that will automatically blocked entrance towards infected persons without using any human resources. Moreover, the data collected from the various scans are stored in an online database that can be monitored by the administrator of the publishment or building.

1.2 Problem statement

The existing method of procedure for entering establishment or publication with narrow entrance proved to be inefficient in its setting which tempted for improvement. Narrow spaces such as entrance to the vicinity of an office located at the corner of the corridor or restricted places tend to avoid the usage of personal because of the lack of spaces available. Moreover, existing method of procedure also lacks the ability to record the scans. Requirement of human resource would be due for false admittance due to human error. Furthermore, human resource is more expensive in regard to value compared to automated system.

1.3 Project Objective

The main aim of this project is to propose a systematic and effective application that would scan and record body temperatures before logging the data into the database. The objectives are as follows:

1. To develop a monitoring system that will scan and record data into the database using IoT technologies.
2. To create a system that will block entrance to suspected individual.

1.4 Scope Research

The scope research of this projects outlines the use of IoT technologies, Arduino MKR1000, temperature sensor (MLX90614) to scan and detect body temperature. The servo would act as a door that open and close depending on the scan result. The scan data will be recorded into an online database (MySQL) for the administrator to log and access. The setting would otherwise be the same as existing temperature scanner with the individual need to line their forehead with the temperature scanner to communicate with the sensor. The sensor is connected to the mainboard Arduino MKR1000 and the board will hence processed the data and deduced whether the individual is affiliated with COVID-19. If a spike of temperature is detected, the board will close the door (servo) thus denying entrance whilst if the temperature is normal, the board will open the door (servo). The data collected from the scans would be recorded by the board and send to the database (MySQL) via Wi-Fi.

1.5 Project Outline

This report is divided into five chapters that detail the “Development of smart body temperature recording system using RFID tag” project’s implementation. This project is divided into five (5) chapters based on the objectives that have been previously stated and the strategy that has been provided.

- The background of the development of the development of smart body temperature recording system using RFID tag is presented in first chapter. To begin, a problem statement is given, along with a set of objectives to be met to address the difficulties. Moreover, this chapter discusses the study scope and project outline.
- The literature review is based on the second chapter. This section discusses relevant research undertaken by researchers as it relates to the project’s implementation and functionality. The projects are compared to define the underlying concept, theory, and provide a broad image of the essence of execution that is appropriate for this research.
- The methodology to conduct the project is presented in the third chapter. Following a series of methods to develop this project while keeping to the provided objectives is the strategy. A flowchart is also prepared to demonstrate how the complete project system works.
- In the fourth chapter, the specifics of the outcomes obtained from the completion of this project are described. Furthermore, the analysis based on the project's outcomes and discoveries is clearly finished in this chapter.
- The last chapter effectively sums everything up and emphasises the key aspects, as well as deciding if the project's output satisfied the stated objectives. Finally, this chapter will include proposals for future improvements to this project utilising emerging technology.

CHAPTER 2

LITERATURE REVIEW

This section detailed the literature review based on the research and studies on the available information and details for this project. Primarily, these information and research were taken from various resources such as journals, articles, the Internet, book, and other related previous studies. Thus, this chapter covers the aspects of temperature recording system using. In retrospect, this chapter is necessary for this project as it defined the primary purpose.

2.1 Introduction

Diseases and ailment often affected the environment and without a doubt, the society. In the latest case, the widespread infection of the COVID-19 pandemic has affected the world in many ways. Causing irreversible damage to some and bringing ailments to others. Countermeasures were taken and vaccines were provided to the netizens but in some cases, such as in the working environment, the measures that were taken are not efficient in the effort to prevent the spread. Thus, by installing this project which utilized a fully automated body temperature recording system, the risk of infection could be further hindered by a calculated margin. The purpose of this project is to automate the body temperature recording system and to record the scanned data into the database. Since mostly, in a secluded or private working environment, most entrance were narrow and required an automated system rather than using human resource. Also, most of the already implemented temperature system lack the ability to record the scanned data into the database. This could be rectified by installing this device. Based on this remark, it can be concluded that this project will play a significant function in the effort to prevent the spread of COVID-19.

2.2 Temperature of the Human Body

The degree of heat intensity is measured by temperature. One of the most essential indicators of health is the body temperature. The goal of the body temperature surveillance or monitoring is to look for signs of systemic or viral illness when a person has a fever, and their body temperature is higher than normal [1]. Additionally, it was one of the first clinical signs of sickness in humans and one of the most common reasons for seeking medical help. During an infection, our immunisation system will raise the body temperature to thwart the illness and activate immunological response.

Furthermore, it is imperative that the body temperature be kept in a relatively restricted range to ensure proper operation. The hypothalamus is a component of the brain that is responsible for maintaining an optimal body function environment by constantly adjusting and regulating human body temperature. The thermoregulation process controls heat loss and uptake to keep the body temperature within a narrow range. The human body temperature is mostly stable and independent of the ambient temperature.

Body temperatures in healthy people can vary depending on the biological and surrounding factors such ambient activity level, temperature, gender, and age. Nevertheless, it is known that the individual's age and the ambient temperature which undoubtedly have the greatest impact on body temperature [2]. The average body temperature range for various ages is shown in Table 2.1. Despite the variations, a healthy and normal human's body temperature should be maintained within the range of 36.5 to 37.5 degrees Celsius [3].

Moreover, there are two extreme states of temperature cases that had to be noted which are hyperthermia and hypothermia. Hyperthermia occurs when a person's body temperature rises significantly above the usual temperature range's maximum limit. Hypothermia, on the other hand, happens when a person's body temperature falls below the typical temperature range's minimal limit. Inability and failure to give an immediate medical treatment and response for both hypothermia and heat might result in death. The normal body temperature measurement range is shown in Figure 2.1.

Table 2.1: Human Body Temperature for Different Ages [1]

Body Temperature Range	Hypothermia	Normal	Hyperthermia
Baby (Birth to 2 years old)	36.00 °C	36.00 °C – 37.00 °C	37.00 °C – 38.00 °C
Children (3 to 12 years old)	36.00 °C	36.0 °C – 36.77 °C	38.00 °C
Adult (13 to 40 years old)	36.10 °C	36.1 °C – 37.20 °C	37.50 °C
Elder (above 40 years old)	35.00 °C	35.77 °C – 36.94 °C	37.44 °C – 37.94 °C

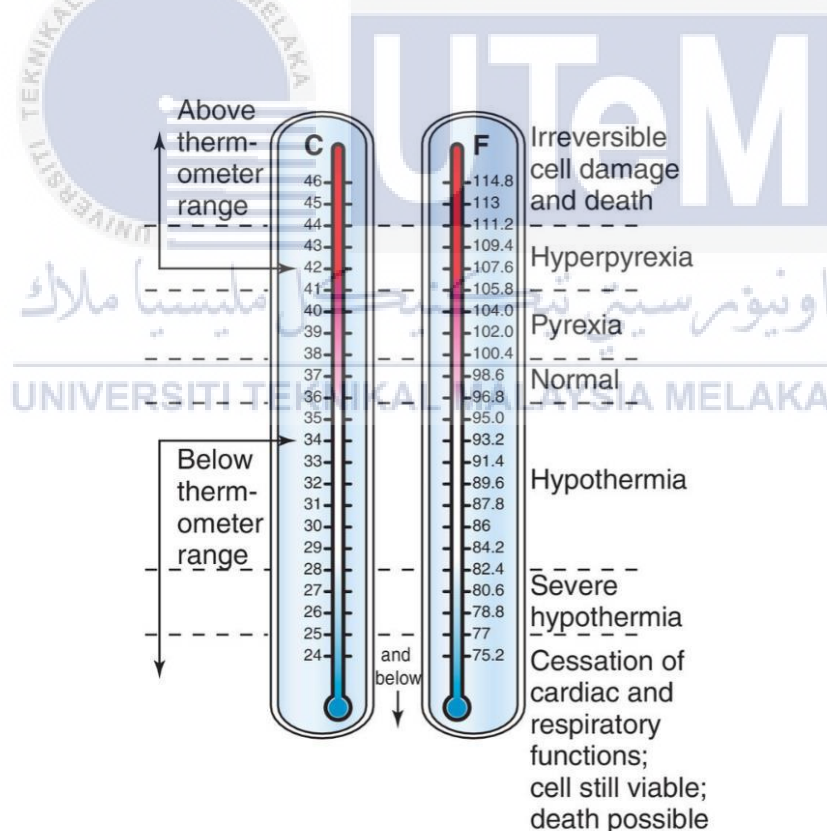

Figure 2.1: Body Temperature Measurement Range[4]

2.3 Comparison of Different Measurement Places for Body Temperature

Table 2.2: Pros and Cons of the body temperature measurement based on different descriptions.

Invasiveness	Location	Pros	Cons
Non-invasive	Forehead Skin	<ul style="list-style-type: none"> Easily accessible and safe 	<ul style="list-style-type: none"> Sensitive to a variety of variables, including sunlight, cold air, and perspiration
	Axillary	<ul style="list-style-type: none"> Safe and easily accessible 	<ul style="list-style-type: none"> Due to the lack of conspicuous blood arteries, this measuring site is unreliable Tendency to introduce inaccuracies and errors
Minimally Invasive	Oral	<ul style="list-style-type: none"> Easily accessible and practical In response to a change in core body temperature, act promptly 	<ul style="list-style-type: none"> Foods, mucosal inflammation, and circulating air can all impact oral temperature
	Rectal	<ul style="list-style-type: none"> As it immediately reflects the core body temperature, this is a potential place for exact body temperature measurement 	<ul style="list-style-type: none"> When there is a fast change in core body temperature due to poor blood circulation, there is a prolonged latency
