

PREVENTIVE CARE TOOL FOR HYPERTENSION AND DIABETES

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

BORANG PENGESAHAN STATUS TESIS*

JUDUL: PREVENTIVE CARE TOOL FOR HYPERTENSION AND DIABETES

SESI PENGAJIAN: 2015/2016

Saya NURSYAFIZILA BINTI AZIZAN

(HURUF BESAR)

mengaku membenarkan tesis (PSM/Sarjana/Doktor Falsafah) ini disimpan di Perpustakaan Fakulti Teknologi Maklumat dan Komunikasi dengan syarat-syarat kegunaan seperti berikut:

1. Tesis dan projek adalah hakmilik Universiti Teknikal Malaysia Melaka.
2. Perpustakaan Fakulti Teknologi Maklumat dan Komunikasi dibenarkan membuat salinan untuk tujuan pengajian sahaja.
3. Perpustakaan Fakulti Teknologi Maklumat dan Komunikasi dibenarkan membuat salinan tesis ini sebagai bahan pertukaran antara institusi pengajian tinggi.

4. ** Sila tandakan (/)

DEDICATION

This thesis is dedicated to my family for their endless love, support and encouragement.

ACKNOWLEDGEMENTS

First and foremost I would like to express my gratitude to the Lord Almighty, whom without His guidance, for keeping me in the path of righteousness I would not have been able to be as I am today.

I would also like to thank to my beloved parents, Khalijah Zakaria, Azizan Rejab, to my brothers and sisters for their endless love and support throughout my life. Thank you for giving me strength to reach for the stars and chase my dreams.

I would like to console my deepest apologies to my lovely parents. I am sorry for not being able to making it back home for the past few months. I just want them to know, I am working at my very best to ensure their smile when they see me succeed. And when that day comes, I would like to dedicate the success to them. I will give my very best, to ensure that they will get a better living once I have reached my goals. There's nothing more that I wanted to achieve in my entire life. But to see my parents, looking back at me and say "That's my daughter over there, we are so proud of her".

Next I would like to thank you to my supervisor Assoc. Prof. Dr Mohd Khanapi Abd Ghani for giving assistant to complete this project successfully and thank you for the wonderful experience for the past few months. Thank you to Umar Mukhtar Bin Hambaran, and also my colleagues for the helping hands.

I would like to express my special thanks Mohd Aiman Afnan Bin Yusof and Nor Syahirah Rahman who are willing to help me and not to forget Wan Fadira who are willing to rent her motorcycle to me. Thank you for your helping hands friends. May God bless you.

And thank you to Muhammad Akmal Bin Noor Azman who has taught me how to handle stress. I myself also surprise that I am able to deal the stress with calm. And I believe our meeting was to develop ourselves. May God bless you.

ABSTRACT

Preventive care is a health services like screenings, check-up and counselling that are utilized to prevent diseases and other health problem. Preventive care is to detect illness at an early stage, by discovering medical problems early; peoples can save money to cure disease because medical cost is very high.

Preventive Care Tool for Hypertension and Diabetes is developed for Universiti Teknikal Malaysia Melaka (UTeM) students and staff. The system is to educate students and staffs practice wellness paradigm. The system scope is focusing on two type of disease that is major health concern in Malaysia, hypertension and diabetes mellitus.

The National Health and Morbidity Survey (NHMS) 2011 has shown that the predominance of hypertension in Malaysia has increased from 32.2% in 2006 to 32.7% in 2011. NHMS also reported that the pervasiveness of diabetes in Malaysia has increased by 31.08% in the space of only 5 years, from 11.6% in 2006 to 15.2% in 2011.

The system is done automatically using medical model that is to analyse patient's records on hypertension and diabetes then generate result from the analysis. The system uses the capabilities of a mobile phone as a communication tool to monitor the patient's health status. The system is developed to analyse, develop preventive model, integrate and test the tool with e-Clinical Support System (e-CSS).

The methodology uses for this project is agile methodology. This methodology is more adaptable than traditional modelling methods, making it a better fit in a quick changing environment. The techniques break product development work into small items. This minimizes the overall risk and allows the project to adapt to changes quickly.

ABSTRAK

Rawatan pencegahan adalah prosedur kesihatan seperti pemeriksaan dan kaunseling yang digukanakn untuk mencegah penyakit dan masalah kesihatan lain. Rawatan pencegahan adalah untuk mengesan penyakit pada peringkat awal, dengan mengenal pasti masalah kesihatan pada peringkat awal, orang awam dapat menyimpan wang daripada menggunakan wang tersebut untuk merubati penyakit yang dihidapi.

Alat rawatan pencegahan hipertensi dan diabetis dibangunkan untuk pelajar dan kakitangan Universiti Teknikal Malaysia Melaka (UTeM). Sistem ini adalah untuk mendidik pelajar dan kakitangan UTeM mengamalkan paradigma kesihatan. Skop sistem ini memberi tumpuan kepada dua jenis penyakit yang membimbangkan di Malaysia, iaitu hipertensi dan diabetis.

Kesihatan dan Morbiditi Kebangsaan (NHMS) 2011 menunjukkan bahawa pesakit hipertensi di Malaysia telah meningkat daripada 32.2% pada tahun 2006 kepada 32.7% pada tahun 2011. NHMS juga melaporkan bahawa pesakit diabetis di Malaysia telah meningkat sebanyak 31.08% dalam jangka masa 5 tahun, daripada 11.6% pada tahun 2006 kepada 15.2% pada tahun 2011.

Sistem ini dilalukan secara automatik menggunakan model perubatan iaitu untuk menganalisa rekod pesakit pada hipertensi dan diabetis kemudian sistem akan menghasilkan laporan dari analisis. Sistem ini menggunakan keupayaan telefon bimbit sebagai alat komunikasi untuk memantau status kesihatan pesakit. Sistem ini dibangunkan untuk menganalisis dan membangunkan model pencegahan, mengintegrasikan dan menguji alat ini dengan Sistem Sokongan Elektronik Klinikal (e-CSS).

Kaedah yang digunakan untuk projek ini adalah metodologi tangkas. Teknik ini lebih cepat menyesuaikan diri pada persekitaran yang berubah-ubah berbanding teknik lain. Teknik ini memecahkan kerja pembagunan kepada lebih kecil. Ini mengurangkan risiko kegagalan projek.

CHAPTER I

CHAPTER I INTRODUCTION

1.1. Introduction

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

Preventive care or prophylaxis is any medical or public health procedure whose purpose is to prevent a disease, rather than treat or cure a disease. Preventive care measures are divided between primary prophylaxis and secondary prophylaxis. Primary prophylaxis means the prevention development of a disease, while secondary prophylaxis means the diseases has already developed and the patient is protected against worsening of this process.

Blood pressure, sometimes called hypertension is a common disease in which blood flows through arteries at higher pressures than normal

pressures. Blood glucose is a sugar that is transported through blood stream. Higher level of blood sugar is known as hyperglycemia. It normally occurs when there is not enough insulin in the body. Blood pressure and glucose is worldwide unsolved problems due to unhealthy lifestyle. Preventive action can be taken to avoid a person getting the diseases.

Preventive Care Tool for Hypertension and Glucose project is to analyse, develop preventive care model and integrate and test the tool with e-CSS system. Roughly, the tool will analyse information on patient's records of blood pressure and glucose and generate result from the analysis. The result is very useful for patient to know their current health status. From the result, patients able to follow and plan their healthy lifestyle in order to prevent the development of the diseases and avoid from the diseases worsening.

1.2. Problem Statement(s)

- i. Preventable death includes hypertension and high cholesterol is unsolved problem due to unhealthy lifestyle habit.
- ii. Lack of study on ICT and decision model to assist patient on controlling the diseases.

1.3. Objective

This project embarks on the following objectives:

- i. To analyse preventive care model for blood pressure and glucose
- ii. To develop preventive care model for Preventive Care Tool for Hypertension and Glucose
- iii. To integrate and test Preventive Tool for Blood Pressure and Glucose with e-CSS

1.4. Scope

1.4.1. System's functionality

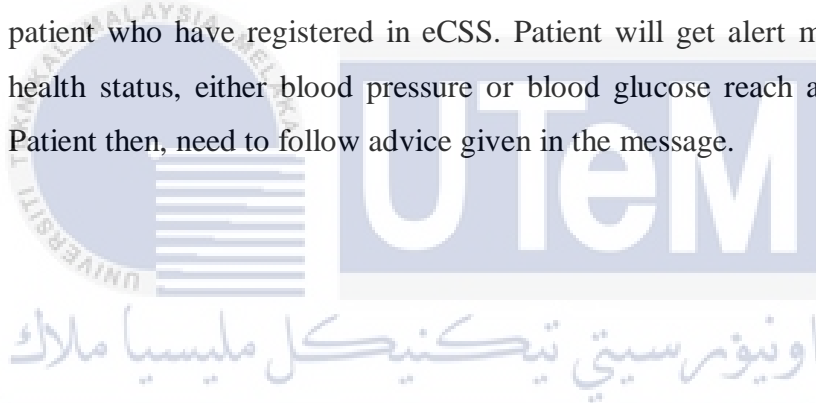

The system is expected to handle two type of disease; there are blood pressure and blood glucose. For blood pressure and blood glucose, the system should analyse systolic and diastolic reading (for blood pressure) and blood glucose level (for blood glucose) for each patients in every 30 minutes. System will get all required data from database. If the result from the analysis is match certain condition, the system should send alert message to patients' mobile phone. The system will run for next 30 minutes, this time, system will only read data that never been read/analyse before.

The system also expected to be able to send alert message to patient's mobile phone if the result match certain condition. The message body must

contain short and precise alert message to make sure patient do not have difficulty to read the message and does not take too much time to understand the message.

1.4.2. System's user

The user of Preventive Care Tool for Hypertension and Glucose is patient who have registered in eCSS. Patient will get alert message if their health status, either blood pressure or blood glucose reach abnormal state. Patient then, need to follow advice given in the message.

1.5. Project Significance

Diabetes mellitus and hypertension is a major public health concern in Malaysia. The National Health and Morbidity Survey (NHMS) 2011 have indicated that the prevalence of diabetes in Malaysia has increased by 31% in the space barely 5 years starting from 2006 to 2011. The adult prevalence of hypertension in 2000 is 26.4%, by 2025 it is expected will up to 29.2%. Hypertension and diabetes is leading risk factor for mortality, in charge of 13% of deaths globally. Thus, this project idea is to help people with hypertension or diabetes to personalize their health care to avoid or reduce death cause by hypertension and diabetes.

1.6. Expected Output

The main expected output for this project is personalized health care tools for preventive purpose. This tool also contains a model to analyse abnormal state of patient's blood pressure and blood glucose. The system able to analyse existing data from eCSS then generate result, if result match specified condition the tool will generate alert message. This tool able to generate automatic alert message via short message service.

1.7. Conclusion

As conclusion, Preventive Care Tool for Hypertension and Glucose can help user to track their hypertension and/or diabetes status and they able to take recommended action to ensure their health is in good condition. Besides that, this tool also might help to reduce death cause by hypertension and diabetes as the alert message is sent to user and user can take preventive action as early as possible.

CHAPTER II

2.1 Introduction

اونيورسيتي تيكنيكل مليسيا ملاك

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

This chapter will discuss facts and finding about blood glucose and its problems, blood pressure and its problems, preventive health care technology, mobile phone usage in Malaysia, mobile phone and health care service and existing system and technology in preventive health care technology. The chapter also will list out the project requirements including software and hardware requirements. Lastly the chapter contains project's milestone and project's Gantt chart.

2.2 Facts and findings

This section will focused on previous research on sub topic below made by other researcher that related to this project.

2.2.1 Blood glucose and its problem

According to Ministry of Health Malaysia, blood glucose or diabetes mellitus is a common chronic disorder, as for now there is no known cure for the disease, yet the disease can be controlled enabling the person to lead a healthy and productive life. The accompanying graph traces the standard blood glucose ranges for a man who does and does not have diabetes.

Table 1 Blood Glucose Reading Chart

Blood Level	Glucose	Excellent	Good	Acceptable	Poor
Before meal	mmol/L	4.0 – 6.0	6.1 – 8.0	8.1 – 10.0	>10
	mg/dl	72 -109	110 – 144	145 – 180	>180
2 hours after meal	mmol/L	5.0 – 7.0	7.1 – 10.0	10.1 – 13.0	>13
	mg/dl	90 – 126	127 – 180	181 – 234	>235

The National Health and Morbidity Survey (NHMS) 2011 has demonstrated that the commonness of diabetes in Malaysia has increase by 31% in the space only 5 years, from 11.6% in 2006 to 15.2% in 2011. This implies there are right now around 2.6 million grown-ups age 18 years and above living with diabetes (abnormal blood glucose). Toward the end of

December 2012, the registry contained 657 839 records which 653 326 were determined to have diabetes.

2.2.2 Blood pressure and its problem

Blood Pressure is defined by four blood pressure reading classifications: normal, pre-hypertensive, first hypertensive and second hypertensive reading. Below is a table of recommended blood pressure follow-up table.

Table 2 Blood Pressure Reading Chart

BP Classification	Systolic BP (mmHg)		Diastolic BP (mmHg)
Normal	< 120	And	< 80
Pre-hypertension	120 – 139	Or	80 - 89
First Hypertensive	140 – 159	Or	90 - 99
Second Hypertensive	160	Or	100

From the Management of Moderately Elevated Blood Pressure Report stated that, in Malaysia, many patients who have hypertension are under-diagnosed. 30% of the have never been diagnosed and reported to hospitals. It was found that 41% of hypertensive patients have never been on medication and present with life-threatening complication (National Health and Morbidity Survey).

Datuk Seri Liow Tiong Lai, Malaysia Health Minister said that during the study on the intake of salt through urine analysis last year found that one in three or about 32.7% of Malaysians aged 18 years and above are now

diagnosed to have high blood pressure. He then advised the public to take steps in reducing salt intake by having routine health screening.

2.2.3 Preventive health care technology

Preventive health care must be planned and executed, even when illness is absent. The best method to properly maintain a good health is concern about food and practice healthy lifestyle. As time goes by and technology evolved very quickly, technology can help to keep people healthy and out of the hospital.

“Expanding the capabilities of our cell phones would bring prevention and early diagnosis directly to us. These devices could monitor blood pressure, EKG and heart rhythms, glucose levels, pacemakers, vaccination schedules, colonoscopies, breast exams, doctors’ visits and a host of other possibilities.”(Ferenc, Jeff, 2013)

Technology could help doctors to monitor patients’ status. This statement is supported by Riley. Riley said advanced technology already is helping doctors manage patients’ diabetes through the use of wireless blood glucose meters, which transmit data to health professionals.

2.2.4 Mobile phone and health care services

Nowadays, mobile phone has become need to each of us, because these technology help to enhance the productivity of our daily task. There is a huge opportunity around personal devices being used to send reminders and alerts to patients about preventive care measures, said Laura Kreofsky, principal of Impact Advisors, a health care technology consulting firm.
