Machine vision in character recognition / Yao Tee Seng.

**MACHINE VISION IN CHARACTER**

**RECOGNITION**

**Yao Tee Seng**

**Bachelor of Mechatronics Engineering**

**May 2010**

“I hereby declared that I have read through this report entitle “*Machine Vision in Character Recognition*” and found that it has comply the partial fulfillment for awarding the Bachelor of Mechatronic Engineering.”

Signature : .....

Supervisor's Name : Mr. Prof. Madya DR. Ismadi Bugis

Date : .....

**MACHINE VISION IN CHARACTER RECOGNITION**

**YAO TEE SENG**

**This Report is submitted in Partial Fulfillment of Requirements for Bachelor of  
Mechatronic Engineering.**

**Faculty of Electrical Engineering**

**UNIVERSITI TEKNIKAL MALAYSIA MELAKA**

**MAY 2010**

“I declare that this report entitle “*Machine Vision in Character Recognition*” is the result of my own research except as cited in the references. The report has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.”

Signature :  .....

Name : YAO TEE SENG

Date : 11 May 2010 .....

To my beloved mother and father

## **Acknowledgment**

First for all, I would like to thank my supervisor, Prof. Madya DR. Ismadi Bugis who guide me a lot for my FYP project. Without the help of my supervisor, I may unable to complete this project on time and make it function as what I predict. Although sometimes Prof. Madya DR. Ismadi Bugis feel not well because of the disease he get but he still really to help me when I having any problem.

I also wish to express my gratitude to my family for their support on my study, because of their support, I can put more time and concentrate in doing my project. Without their mentality and financial support, I may be unable to continue my study till this stage.

Lastly I would like to thanks for my friends for their support and constructive suggestions and criticisms on my project and also for those individuals who have been directly and indirectly involved and kindly shared their knowledge and idea in order to complete this FYP project.

## **ABSTRACT**

As mention in the project title, this project is to design a machine vision system that can recognize character writing. Unlike other machine vision project, this machine vision system is build up with fundamental of image processing concept and add in an intelligent function. This project also difference with other character recognize product, because this project is using a webcam to capture input of the project and not using touch screen to write in character. The software part of this project will be build up with using VB.net or C programming and the hardware part will be a computer base system with the input image source is capture by webcam.

## ABSTRAK

Sama seperti dengan yang di nyatakan di tajuk, tujuan projek ini adalah mengaplikasikan satu sistem penglihatan mesin yang boleh faham tulisan. Beza system penglihatan mesin ini dengan yang lain adalah system ini di cipta dengan menggunakan konsep “image processing” dan ditambah dengan fungsi kecerdasan mesin. Sistem ini juga berbeza dengan sistem mengecam tulisan yang sedang ada di pasaran disebabkan sistem ini menggunakan “WebCam” untuk dapatkan gambar masukan dan sistem lain pula menggunakan “touch screen”. Pengatucaraan komputer yang digunakan untuk buat sistem ini adalah Visual Basic .net atau bahasa C dan sistem ini dibuat berdasarkan komputer sistem dan media untuk masukan image adalah “WebCam”.

## **CHAPTER1**

### **INTRODUCTION**

## 1.1 PROBLEM STATEMENT

Nowadays human energy is replaced by machine in certain field to increase working efficiency. This phenomenon can be found especially in production line. Production line is one of the important departments in an industry, so there is a need of increase the worker working performance to increase the productivity of production line. As human, we know that we are easy affected by other out coming effect such as family problem, financial problem and so on. Such of this problem will decrease our working performance; indirectly it will affect the productivity in the production line. As an example, usually human energy is used to check expired date of a product, but base on the weakness of human ability, the worker easy make mistake especially when working in long period of time because of feel tired. This problem can be avoided by using machine vision for checking expired date in production line. It will increase the speed, accuracy and improve the performance for a production line.

There are still a lot of people sending their document or items by post. Using human energy to sort the sending document or items follow their postal code is not practical and low efficiency. Replacing human energy with machine vision system, will increase the performance of work, this is because machine vision system is able to recognize the postal code and sort the document according to their postal code.

In this century, time is an important asset for us; especially for business man, they need to save their time for having more business to gain a maximum profit, but unfortunately, they spent a lot of time in sending message, documents and data to their clients or workers; it will consume a lot of time for them in typing out message from a mobile phone instead of using handwriting. Maybe they will write message in a piece of paper and send it for their clines or workers, but, not every word from that handwriting will easily read by clines or workers because handwritten characters vary greatly, to solve this problem, we need a system that change the handwriting to proper typing words, we call this system as “machine vision”.

## 1.2 PROJECT OBJECTIVE

The main objective of this project is to design a machine vision system that can recognize character. The idea of this project is to make machine able to learn and understand human handwriting besides of typing character.

Another objective of this project is to design an image processing algorithm with programming skill. There is a lot of image processing algorithm library in market, e.g. OpenCV, for application purpose, we can just use that library to build up some image processing function, but for research purpose, we need to understand and to know the method or algorithm that usually builds up image processing system. Through this project, an image processing algorithm will be designed and used for purpose of character recognition to proof the image processing algorithm can function effectively.

Design a recognition system from those of the artificial intelligent system that already exists is also one of the objectives for this project. Through this project, a recognition system is design to recognize an input character of the system.

### 1.3 PROJECT SCOPE

The result for this machine vision system will show in programming forms such as visual basic.net, C++ builder. The project will more concert in programming and theoretical, the hardware used for the system will not be covered fully in this project. To get a good result for this system, the input handwriting character preferred to be uniform and the tool used for writing is suggest to be 2.0 m/m tip with black in color. Character set is uppercase alphabets A until Z, other type of character such as numeric number and lowercase alphabets will not be cover in this project. The background of this machine vision system is suggested to be white in color with noiseless condition. The testing environment is suggested to be brightness condition. This machine vision system is a computer base system that required the processor of Pentium D (3.00MHz), RAM 1G or above and the input for the image source is a webcam with 1.3 megapixels.

## **Chapter2**

### **LITERATURE REVIEW AND PROJECT BACKGROUND**

## 2.1 LITERATURE REVIEW

### 2.1.1) PROGRAM (Software)

#### 2.1.1.1: Optical Character recognizes system by Herve Cadieu

This optical character recognizes system is created by Herve Cadieu in VB 6 programming base. The system is tested by write a character in the text box given. After some training has been done for the system, the system can recognize the character that is written in the text box. But this system still have a lot of weakness, the percentage of success is not high and this program does not have filtering function, so it can just recognize a character that is no noise, beside of that, this is a program that does not involve image processing theory so it cannot be classify as a machine vision system [8] [9]. But the programming method that use to recognize character is helpful in building a machine vision system that recognize character.

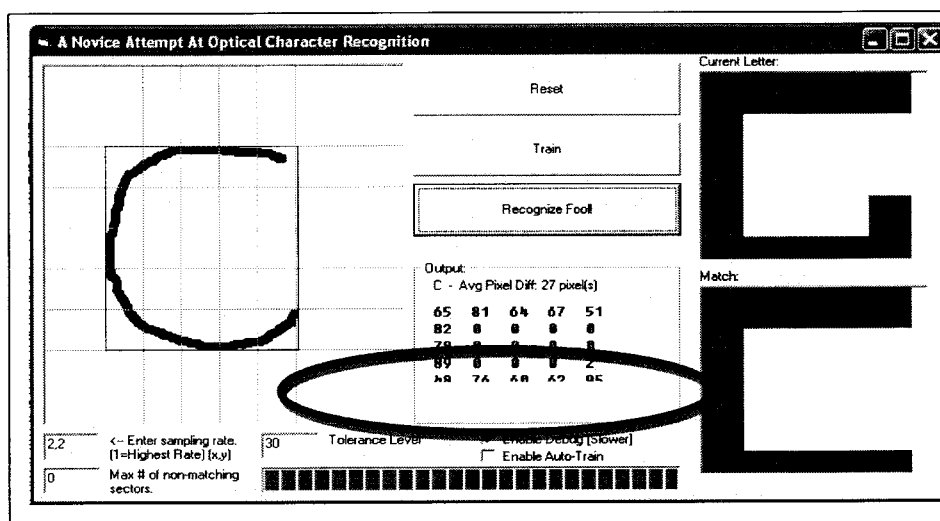

Figure 2.1: Result shows that the system success recognizes the character "C"

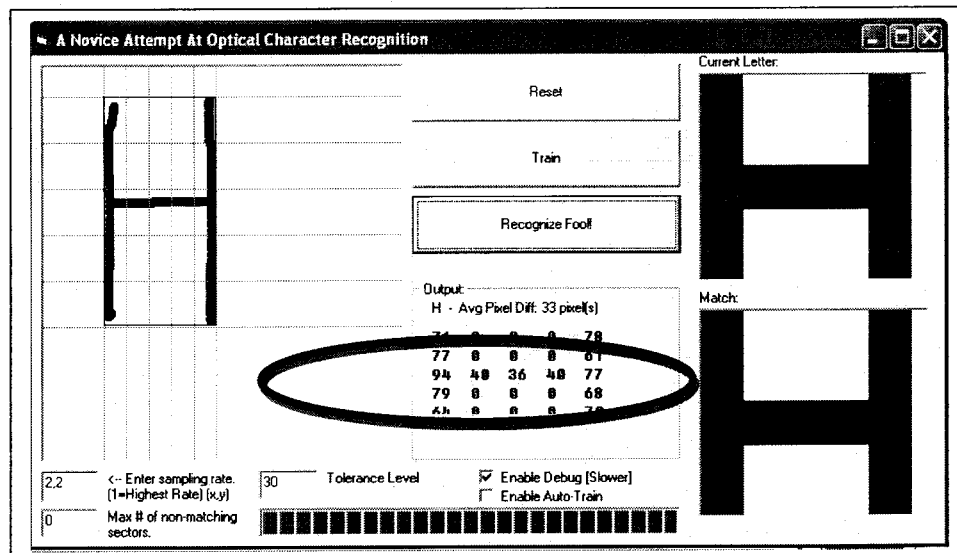

Figure 2.2: Result shows that the system success recognizes the character "H"
