ACKNOWLEDGEMENT

Alhamdulillah, after all the effort of work and studies, this report of *Projek Sarjana Muda (PSM)* has finally completed. This one year of the PSM is able to complete within the frame time with the help of the some people who have willingly to share knowledge, ideas and lend their hand to me while completing this training. Therefore, I would like to take this opportunity to express my token of appreciation to those who have directly or indirectly involved in this project.

Firstly, I would like to thank both my parents for their support upon completing this project. My deepest thank goes to my supervisor, Mr. Mohd Zaid bin Akop. Thank you very much for sharing his expertise knowledge, thoughts and ideas with me. Thanks for all the guidance he have given to me. Without his guidance and advice, I would not be able to perform my research project.

A token of appreciation also goes to all my friends and all my fellow course mates in making this PSM a success. Thank you for their time, knowledge and skill for helping me in terms of ideas, transportation, facilities, financial, etc.

Hopefully my PSM will be helpful and beneficial to people who are interested to make further study in this field. Lastly, thank you very much again and certainly, it would be impossible to complete the PSM without helps from all of them.

ABSTRACT

Solar energy is a form of energy produced from the sunlight and it is a renewable while friendly to the environment. This solar energy can be converted to electrical energy through a photovoltaic process or also known as solar cells, which it is a device that made up from a semiconductor and capable to transform the sunlight to electrical energy in a form of direct current (DC). Therefore, realizing the advantages of this energy, many academicians and researchers has involved in elevating the technology of this energy and study the feasibility in daily life instead of creating various devices that use solar energy as the power sources. Thus, this report is made to study the feasibility and design a 'Highway Dummy Signal' as an alternative to the battery operated. This report is also contained the methodology to build the 'Highway Dummy Signal' based on solar energy system. Apart from that, this report has also studied the difference of total cost for the both systems and the time duration for capital returning when using solar energy system.

ABSTRAK

Tenaga solar ialah satu bentuk tenaga yang terhasil daripada sinaran Matahari yang mana tenaga ini merupakan sumber tenaga yang boleh diperbaharui dan tidak mencemarkan alam sekitar. Tenaga solar yang terhasil ini dapat ditukar kepada tenaga elektrik melalui proses photovoltaic (PV) dan dikenali juga sebagai sel-sel solar, iaitu suatu alat yang diperbuat daripada semikonduktor yang berupaya menukar cahaya Matahari kepada tenaga elektrik dalam bentuk arus terus (DC). Oleh itu, menyedari akan kelebihan tenaga ini, ramai ahli akademik dan pengkaji melibatkan diri dalam meningkatkan lagi teknologi tenaga ini dan mengkaji kesesuaiannya dalam kegunaan seharian disamping mereka pelbagai alat yang menggunakan tenaga solar sebagai sumber tenaga elektrik. Justeru, laporan ini disediakan untuk mengkaji kebolehlaksanaan dan mereka bentuk sebuah 'Highway Dummy Signal' daripada menggunakan sistem bateri sebagai sumber tenaga elektrik kepada satu sistem yang berasaskan kepada tenaga solar. Kertas kajian ataupun laporan ini turut mengandungi metodologi untuk mereka bentuk 'Highway Dummy Signal' berasaskan sistem tenaga solar. Disamping itu, laporan ini juga mengkaji perbezaan kos keseluruhan untuk kedua-dua sistem dan jangka masa pulangan modal apabila menggunakan sistem tenaga solar.

CHAPTER 1

CHAPTER 1

INTRODUCTION

1.1 Background Study

Solar energy is the radiant light and heat from the Sun that has been harnessed by humans since ancient times using a range of ever-evolving technologies. This energy is produced when the insulation surface in solar cell such as silicon is affected. This beam will charge ions in this silicon and produced a power namely electricity or fondly known as solar energy. Realizing the advantages and goodness of using solar energy, a study is made to replace battery consumption as source of electricity supply to system solar. Medium use to this study is highway dummy signal because this tool is customary expended at construction site such as on highways where there is no electricity supply from grid. Furthermore, highway dummy signal nowadays uses battery as main source to supply electricity to move motor. Like those known, battery should always being charged to ensure energy produce is enough and battery need neat care to extend life span of the battery. So, this study is aimed to compare suitability and advantages in using solar system in highway dummy signal with battery consumption.
