“I hereby declare that I have read this report and in my opinion this report is sufficient in terms of the scope and quality for the award of Bachelor of Electronic Engineering (Industrial Electronics) With Honours”

Signature :.....  
Supervisor's Name : Puan Azdiana binti Md. Yusop  
Date :.....

*Dedicated To my beloved mother, my late father, my family and members of the  
electronics academia.*

## ACKNOWLEDGEMENT

The highest of gratitude to Allah S.W.T, The creator of all for His blessing and mercy has allowed me to live and serve in this world of His. This feat thus far can only be accomplished only if He allows it.

Thank you also to my supervisor and teacher Puan Azdiana binti Md Yusop for guiding me towards the journey of completion. Your knowledge on the various things has greatly increased my confidence in doing this project.

I would also like to thank my family and friends for supporting me towards the end. All of your support has motivated me in many instances. All of the experience has been educating, humbling and very nostalgic.

Thank you all.

## ABSTRACT

Based on the leading technology of microwave band long range radio frequency identification, this system is design to monitor attendance and control the access system using RFID system.

This system can completely control the access to the area with automatic identification process and automatic attendance record system, with each vehicle is equipped with an active sticker/ tags which is previously registered on the system. The active sticker will send microwave signal constantly to the reader.

When the reader installed near the gateway has receives the signal from the active sticker/tags, it will transmit the signal to the gateway controller (PIC 16F876A).

Then the RFID system will verify the validity of the sticker. If valid, the time of arrival is recorded as part of the attendance and the relay on the controller will drive the gate open and permit the vehicle's access.

If the sticker is not valid, microcontroller will not function and the gate will remain closed. A camera will then take the picture of the affected vehicle. The images are saved in the database.

A computer can be installed at the gate guard's room to supervise the vehicles' in/out, the time of arrival, the department of which the owner of the vehicle works in and the photograph of the vehicle.

## ABSTRAK

Berdasarkan teknologi gelombang mikro sistem ini direkabentuk untuk memantau kehadiran dan mengawal akses menggunakan sistem RFID. Sistem ini akan sepenuhnya mengawal aliran keluar masuk dengan process mengenalpasti secara automatik dan mengambil masa kedatangan secara automatik. Setiap pekerja/ pelajar, ataupun orang dalaman akan dibekalkan dengan kad yang perlu berdaftar terlebih dahulu pada pangkalan data..Kad tersebut bertujuan sebagai kad pengenalan diri yang menunjukkan pemegang kad tersebut merupakan orang dalaman kawasan tersebut. Pelekat akan menghantar isyarat gelombang mikro terus menerus untuk pembaca.

Ketika pembaca yang dipasang berhampiran pintu pagar telah menerima isyarat dari kad yang aktif, ia akan menghantar isyarat ke pengawal pintu pagar (PIC16F876A).

Pembaca RFID akan mengesahkan kesahihan kad tersebut. Jika sah, waktu kedatangan direkodkan sebagai sebahagian daripada kehadiran dan geganti pada pengawal akan mendorong pintu terbuka dan membolehkan kenderaan masuk.

Jika kad tersebut tidak sah, pengawal tidak akan berfungsi dan pintu tidak akan terbuka.. Sebuah kamera akan mengambil gambar kenderaan yang tersebut. Gambar akan disimpan di dalam pangkalan data..

## **CHAPTER 1**

### **INTRODUCTION**

#### **1.1 Project Introduction**

Attendance is define as the act of being present (at a meeting or event etc.), the frequency with which a person is present or the number of people that are present. Attendance is one of the important factors that affect the staff performance in work.

Attendance and access control systems are used by companies of all sizes to record working hours of employees in order to pay their wages. Some companies have a requirement to record the number of hours spent on specific tasks in order to evaluate the jobs accurately. This is referred to as job costing.

Companies with large number of employees might need to install several clocking points in order to speed up the process of getting all employees to clock in or out quickly or to record activities in dispersed locations.

The suitable solution for this problem is by design a system that will record attendance automatically. In this project, Radio Frequency Identification (RFID) system used to record student attendance automatically

These actions require a more systematic and advanced monitoring system. The suggested monitoring system will use RFID as the main technological driver. RFID (radio frequency identification) is a new technology that incorporates the use of electromagnetic or electrostatic coupling in the radio frequency (RF) portion of the electromagnetic spectrum to uniquely identify an object, animal, or person.

An RFID system consists of three components, an antenna and transceiver and a transponder or known as tag. The antenna uses radio frequency waves to transmit a signal that activates the transponder. When activated, the tag transmits data back to the antenna.

RFID technology differs from bar codes. RFID can read the tag using RF, meaning that the RFID reader can be read from a distance, right through your clothes, wallet, backpack or purse. Besides the RFID tag consist of unique identification (ID) for each tag.

The technology used in RFID has been around since the early 1920s. In our country, this technology already been used for several years in certain places. Some places, they prefer to used Barcode which is cheaper than RFID. Technology spread very fast. In few years later, there is not impossible if RFID will replace the barcode system in today's life.

This project will used ID card as RFID tag. The identification number on the card will indicate the information of user. Each ID number has pre assigned in the database. The data in this context consists of the name, department, the ID number and car plat number. This project is developed to track the number of attendance of people in the desired workplace. This method is more effective to prevent problem in process getting attendance manually.

## 1.2 Project Objectives

This project is attempt to::

- 1.1.1 Design the attendance and access control system using the RFID system with extensive supervision.

## 1.3 Statement Of Problem

Currently the method that companies use to control the flow of people coming in and out is very lacking. People (employees or outsiders) can go in and out of the company's premises with minimal supervision. Important records such as picture and time of entry or exit are not properly managed or recorded. The attendance system also has the absolute potential of wasting valuable time since the employees need to line up and wait their turn to tally up hand-written time cards or punch clock cards manually.

## 1.4 Scope of project

The project is created in based on the scope. The scope is important to ensure the manufacturing of the project according as planned. However, this scope can be changed to obtain better results. Among the initial scope set is:

- 1.4.1 This system can be used in big companies, industries, colleges, schools, etc where there are many numbers of candidates available.
- 1.4.2 Total width of the passage should be 4~6m, one entrance and one exit. Example like UTeM.
- 1.4.3 There's no need to stop if necessary. The passing speed should be under 60 km/h.
- 1.4.4 The identifying process is full automatic, which can avoid the problem that driver must open the window to punch the card in bad weathers.

## **1.5 Methodology**

This project began with the research of the proposed title. The result of that research is then discussed with the supervisor. Once we have agreed with the supervisor on the title, the background study of this project is searched. Here, theories on this project are found. When the project has progressed thus far, the process of designing the system can be done. Components can now be chosen and the control elements programmed using the desired software. An interface device should also be chosen. The correct software is chosen to comply with the control elements. The flowchart of the system shown below in figure 1.1

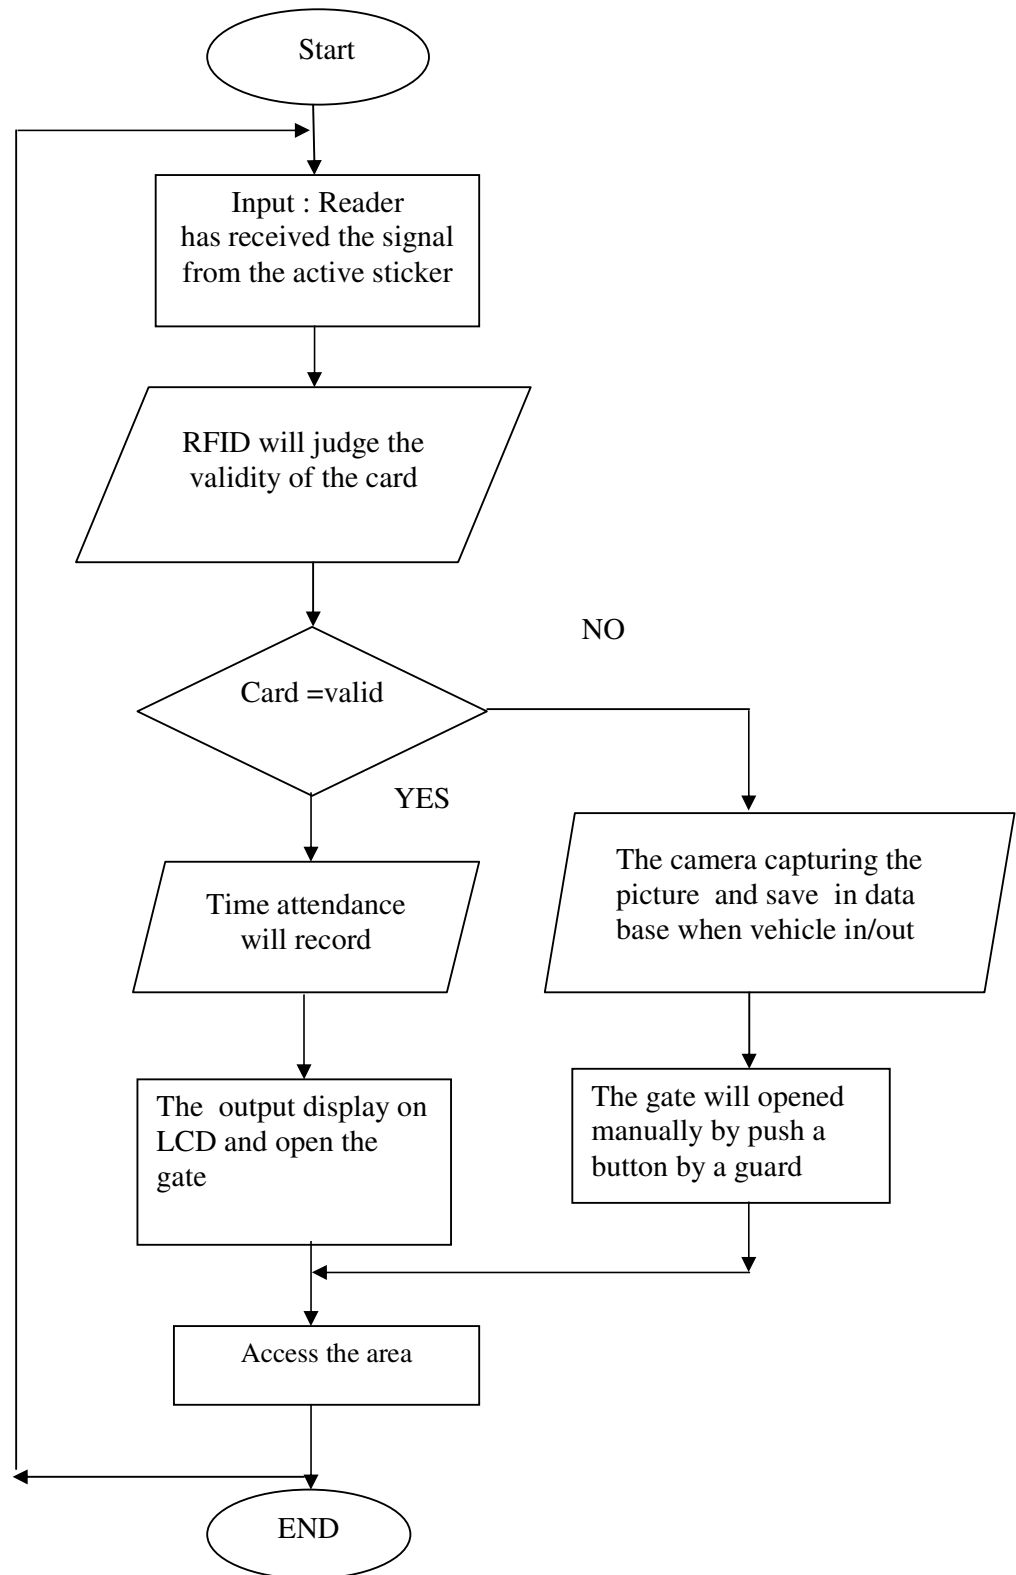

Figure 1.1: Flow chart of Attendance And Access Control System Using RFID System

## 1.6 Report Structure

This report shall explain how this project came to be. What is done thus far is compiled in this report. All of contents of this report are useful to fast pacing this project to the next level. So it is important that the contents of this report to be thoroughly researched and put into place.

Chapter 1 introduces the project as a whole. The early and basic explanations are mentioned in this chapter. This chapter consists of the project's objectives, statements of problems, scope of work, and the simplified methodology.

Chapter 2 is literature review. Past projects or researches are taken into consideration when completing this chapter. The ways those projects and researches are done are compared with what this project is all about. These comparisons are done to understand what this project is all about and where it stands.

Chapter 3 explain on the components used in this project. It is divided into two parts; the hardware and the software. Each part explains the components, software and programmes used in this project.

Chapter 4 explains how this project came to be. It is the methodology. The ways and procedures in which this project is done. This chapter will enlighten the part most important of all, the flow this project. What is researched and what needs to be done is explained in this chapter.

Chapter 5 concentrates on the result and discussion of this project. What has been done thus far is explained in diagrams and written programs. Why the results are like so will also be explained. The reasons and setbacks that cause the project to be halted are discussed in this chapter. The expected results will also be mentioned in this chapter.

Chapter 6 is the final chapter in this report. The conclusions and recommendations are placed in this chapter. The conclusion is the final overview of this project. In other words, the conclusion is the summary of what has been done

throughout this project. After the project is done, recommendations are made for the betterment of this project or any expansions or upgrades that might be done in the future.
