

AUTO VOLTMETER MEASUREMENT TOOL SYSTEM

Muhammad Luqmannul Hakim Bin Ahmad Buhairi

Bachelor of Mechatronic Engineering

2010

“I hereby declare that I have read through this report entitle “Auto-Voltmeter Measurement Tool System” and found that it has comply the partial fulfillment for awarding the degree of Bachelor of Electrical Engineering (Mechatronic)”

Signature :

Supervisor's : Mr. Zaihasraf Bin Zakaria

Date :

AUTO-VOLTMETER MEASUREMENT TOOL SYSTEM

MUHAMMAD LUQMANNUL HAKIM B. AHMAD BUHAIRI

A report is submitted in partial of fulfillment of the requirements for the degree of

Bachelor in Electrical Engineering (Mechatronic)

Faculty of Electrical Engineering

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

2010

I declared that this report entitle “Auto-Voltmeter Measurement Tool System” is the result of my own research except as cited in the references. The report has not been accept for any degree and is not concurrently submitted in candidature of other degree.

Signature :

Name : Muhammad Luqmannul Hakim Bin Ahmad Buhairi

Date :

Dedicated to my beloved mother, father, my siblings
And all my friends,
For their love and sacrifice

ACKNOWLEDGEMENT

Thanks to Almighty, after many months of hard works in completing FYP1 (Final Year Project 1), at last this report has been completed. Finally, the day has comes for me to expressing my gratitude to anyone who has make contribution in completing the FYP 1 project. I would like to extend my highest appreciation and gratitude to:

First and foremost, Mr Zaihasraf Bin Zakaria, as my FYP supervisor, who has inspired and guided me in achievement of this Project Report.

He inspired me greatly to work in this project. His willingness to motivate me contributed tremendously to my project. I also would like to thank him for willingness to showing me some example that related to the topic of my project.

Finally, an honorable mention gifted to my family members and friends for their understanding, willingness and supports on completing the project.

ABSTRACT

In industry, maintenance routine is compulsory to be done for machines or power station in any factory or office. This is to ensure that the machines or power supply does not have faulty error during any production time or business. If it happen, it will affect the whole company production and cause to money loss and waste of production time. Thus, these will become a problem that need to be solve. As a scenario, during industrial training program that is held for degree students, there is a company conducting a preventive maintenance for uninterruptible power supply (UPS). A voltmeter, is a common item that is use for voltage measurement by maintenance technician. During maintenance routine of UPS, technician need to check the condition of battery backup for UPS system to ensure it does not have faulty error when main power is down. There are several chances of having danger of electrical shock due to a problem while measuring voltage of the backup battery. It is because of narrow space in the battery rack, which is fixed enough for only to place the battery. Thus, there is not enough space for technician to reach the positive and negative battery terminals. Therefore, a project called '**Auto-Voltmeter Measurement Tool System**' were proposed to overcome the problem. The objective of this project is to develop an automatic voltmeter system that can take readings automatically without the needs of technician to take the readings of the backup battery by themselves. This project using the PIC16F877A as a microcontroller to control the meter base and contact point of the auto-voltmeter system. The input is received from readings taken by contact point (meter probe) and the result will be display in LCD for technician record. The project consists of two parts, hardware development and software development. Implementation and works of this project are summarized into the flow chart in this report.

ABSTRAK

Dalam industri, rutin penyelenggaraan adalah satu kewajipan bagi mesin-mesin atau stesen janakuasa dalam mana-mana kilang atau pejabat. Ini adalah bagi memastikan yang mesin-mesin itu atau bekalan kuasa tambahan tidak mengalami ralat rosak semasa proses pengeluaran atau perniagaan sedang dijalankan oleh syarikat atau kilang. Jika ia berlaku, ini akan menjejaskan keseluruhan pengeluaran syarikat dan menyebabkan kerugian kos dan masa pengeluaran. Oleh itu, ini akan menjadi satu masalah yang perlu diselesaikan segera. Wujud satu senario, dimana semasa program latihan perindustrian yang telah dijalankan bagi pelajar ijazah, terdapat sebuah syarikat menjalankan satu penyelenggaraan pencegahan untuk uninterruptible power supply (UPS). Meter voltan adalah perkakasan biasa yang digunakan untuk mengukur voltan oleh juruteknik penyelenggaraan. Semasa rutin penyelenggaraan UPS, juruteknik perlu memeriksa keadaan bateri sandaran agar sistem UPS tidak mengalami kegagalan apabila bekalan kuasa utama putus atau wujudnya ralat rosak. Bahaya kejutan elektrik boleh berlaku apabila juruteknik melakukan pengukuran ke atas bateri sandaran. Ia disebabkan oleh ruang sempit dalam rak bateri, yang hanya cukup sekadar untuk meletakkan bateri. Oleh itu, juruteknik tidak dapat mengambil bacaan pada terminal positif dan negatif bateri sandaran akibat daripada wujudnya ruang yang sempit itu. Maka, projek yang diberi nama "Auto-Voltmeter Measurement Tool System" dicadangkan untuk mengatasi masalah yang berlaku. Objektif projek ini adalah untuk mencipta meter voltan automatik yang dapat mengambil bacaan secara automatik tanpa melibatkan juruteknik sendiri mengambil bacaan bateri sandaran. Projek ini menggunakan mikropengawal PIC16F877A untuk mengawal tapak utama meter dan prob meter sistem voltmeter. Input akan diterima daripada bacaan-bacaan yang diambil oleh prob meter dan hasilnya akan dipamerkan dalam paparan LCD untuk rekod juruteknik. Projek ini terbahagi kepada dua bahagian iaitu bahagian perisian dan juga bahagian perkakasan. Perlaksanaan dan kerja-kerja pembangunan projek akan diterangkan lebih mendalam berdasarkan carta alir dalam kertas kerja ini.

CHAPTER 1

INTRODUCTION

1.1 Background

A voltmeter is an instrument used for measuring the electrical potential difference between two points in an electric circuit. There are two types of voltmeter existed, which are the analog voltmeter and digital voltmeter. Analog voltmeter move a pointer across a scale in proportion to the voltage of the circuit while the digital voltmeter gives a numerical display of voltage by use of an analog to digital converter.

Voltmeters are made in a wide range of styles. General purpose of analog voltmeter may have an accuracy of a few percent of full scale and are used with voltages from a fraction of a volt to several thousand volts. While digital voltmeter can be made with high accuracy, typically better than 1 percent. Meters using amplifiers can measure tiny voltages of microvolts or less.

During industrial training program that is held for degree students, there is a company conducting a preventive maintenance for uninterruptible power supply (UPS). A voltmeter, is a common item that is use for voltage measurement by maintenance technician. During maintenance routine of UPS, technician need to check the condition of battery backup for UPS system to ensure it does not have faulty error when main power is down. There are several

chances of having danger of electrical shock due to a problem while measuring voltage of the backup battery. It is because of narrow space in battery rack, which is fixed enough for only to place the battery. Thus, there is not enough space for technician to reach the positive and negative battery terminals.

Nowadays, with the vast technology application available, it is possible to create a microcontroller based to control a system which it is programmed to take a battery backup voltage measurement automatically with reducing the danger of the technician may have.

The microcontroller based automatic voltmeter measurement system consists of two elements to be considered:

- i. Software development
- ii. Hardware development

The achievement of the project can be stated that the system will have the ability to make a backup battery voltage measurement automatically with reducing the dangers that technician in maintenance routine may have.

1.2 Problem Statement

During maintenance routine, technician always expose with such dangers like having an electrical shock, electrical spark which can cause paralyzed and sometimes causing some power explosion which is seriously dangerous and can causes death.

There are two problems statement to be carried out of this project. Firstly, the difficulties that technician face while doing the voltage measurement for backup battery during maintenance routine. And lastly, the chances of having danger of electrical shock (short circuit) that the technician may has because of narrow space in the battery rack.

Therefore, with this project we can reduce the danger that the technician may have in the future. Furthermore, the routine of the maintenance can be done with such efficiency and good performance.

1.3 Objective of Project

There are two objectives of this project:

1. To develop an automatic voltmeter system that can take readings of voltage automatically from the backup battery.
2. To help technician during the maintenance routine.

From the first objective, an automated controller for voltage measurer is created with the application of robotic innovation by using microcontroller based PIC to control the system automatically through the whole battery rack for voltage measurement without the intrusion of technician to take the readings. The system running by itself after power is on.

Second objective, the technician job for voltage measurement can be done with ease and efficient with the help of the automatic voltmeter system in the process of completing their maintenance routine for battery backup. Furthermore, the job can be done without harming the technician directly.

1.4 Scope of Project

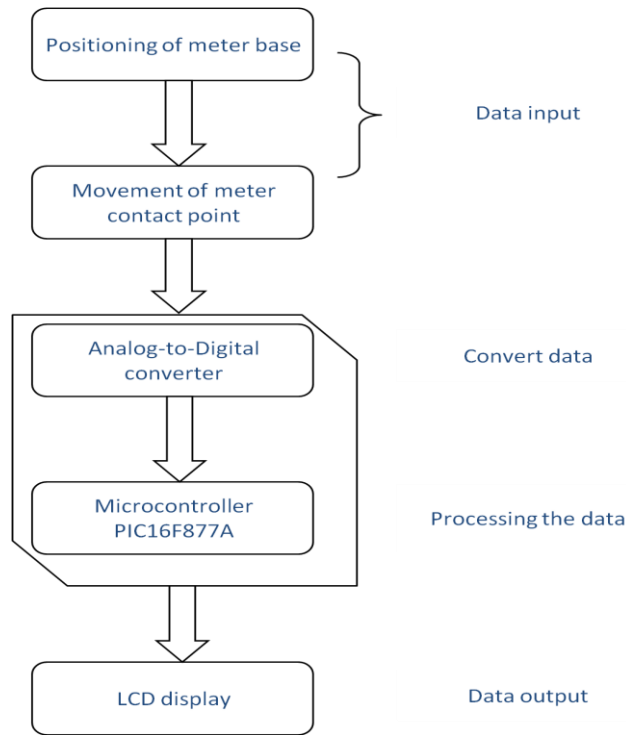

Figure 1.1: System Block Diagram

Auto-voltmeter system consists of three parts, which are the data input, data processing and data output. In the data input part, it has two functioning devices which are the meter base and the contact point mover. As the data processing part, it consist the microcontroller and finally the data output part, LCD display plays the role.

Firstly, the system meter base will reset at the designated initial position. Then, it will move the base according to the battery arrangement. Next, it is the role of the contact point mover. It will take the readings of the battery backup voltage accordingly. After the input of the readings has been received, PIC microcontroller will received the data and display on the LCD.

Lastly, overall scope of the project is to design an automatic voltmeter system controlled by PIC microcontroller and to make an implementation of mechanical design combining with voltmeter to create a semi-robot product.

1.5 Outline of Progress Report

This progress report consists of five chapters. The first chapter of progress report discussing on the background, problem statement, objective and scope of the project. The second chapter consists more on literature review that has been done. It discusses about the theory on component of software and hardware such as a comparison between microcontroller and microprocessor and also type of voltage measurer used in this project. Others, it will also include the type of hardware and software specification that will be used in the project. Chapter three will be explained about the methodology of this project. It consists of two major parts; there are software development and hardware development. Next, chapter four will be present about the result that has been obtained. Finally, chapter five will be discusses about the discussion and suggestion for this project. In the discussion part, it will explained the problem occur when doing the project. In this chapter also, there will be a conclusion included, it will summarize the research and development of this project.

CHAPTER 2

LITERATURE REVIEW

2.1 Introduction

A literature review is a summary of previous research on topic. The purpose of a literature review is to convey all the knowledge and ideas that have been established on a topic and what are the strengths and weaknesses. Literature review has been conducted prior to undertaking this project to obtain the information on the technology available and the methodologies that used by the other researchers on the same topic. This chapter provides the summary of literature reviews on key topics related to the project.
