## **ACKNOWLEDGEMENT**

There are a number of people without whom I would not have started or completed this thesis. First among these people is my supervisor, Zulhani Rasin. Without his guidance my studies in this area would not have been possible. It was through Zulhani's suggestions that I began researching the area of basis programming. I am grateful for both his suggestions and guidance. Most importantly, I would like to acknowledge my friends and family for their support. All too often I would ramble on about a point they wouldn't care about, and still they offered their assistance, support and encouragement. I have valued each comment.

Million thanks to everyone for making life enjoyable and easier through these studies. With heartfelt gratitude I acknowledge those who over the years have answered my questions. It is to those family members and friends who patiently faced my curiosity that I owe my knowledge and abilities.

Finally, this work is reliant on those mentioned in the references and upon the people mentioned above. Without these giants, this work would be mere supposition and I thank them for the solidity their shoulders have granted me.

## **ABSTRACT**

In industrial applications, the monitoring of machine condition or operation has been performed manually. This has caused a demand for a wireless system due to the high cost of wired technology for monitoring purposes. The objectives of the project are to develop a machine monitoring system using a Wireless Sensor Network (WSN) based on ZigBee Technology. This project system is started by developing a machine monitoring system which measures the temperature and voltages of the DC motor that acts as a machine and all the parameters are displayed through a Graphical User Interface (GUI). The GUI is designed using Visual Basic 6.0 software programming language. The hardware component consists of a sensor circuit, a DC motor machine, and the ZigBee WSN module is developed to be integrated with the software component. The hardware implemented is based on WSN of ZigBee Technology. In order to evaluate the overall performance of the machine monitoring system, several measurements were carried out within the indoor and outdoor environment and the result is also discussed.

## **ABSTRAK**

Dalam aplikasi di industri, pemantauan keadaan mesin dilakukan secara manual. Ini telah menyebabkan tuntutan sistem tanpa wayar disebabkan kos yang tinggi di bidang teknologi berwayar melalui aplikasi pemantauan. Objektif projek adalah untuk membangunkan sistem pemantauan mesin menggunakan Rangkaian Sensor Tanpa Wayar (WSN) berdasarkan Teknologi ZigBee. Projek ini bermula dengan membangunkan sistem pemantauan mesin yang akan mengukur suhu, voltan DC motor yang juga bertindak sebagai mesin dan parameter lain akan di paparkan melalui Paparan Pengguna Grafik (GUI). GUI itu direkapi menggunakan perisian bahasa program *Visual Basic 6.0*. Komponen perkakas mengandungi litar suhu, mesin DC motor and modul WSN ZigBee telah dibangunkan untuk di satukan dengan komponen perisian. Pembangunan perkakasan dilakukan berdasarkan Teknologi WSN ZigBee. Untuk menilai prestasi sistem pemantauan mesin, beberapa pengukuran telah dilakukan pada dalaman dan luaran kawasan dan keputusan prestasi itu akan dibincangkan.

## CHAPTER I

### INTRODUCTION

#### 1.1 Project Background

The application of Wireless Sensor Network technology in the design of field area network for industrial communication and control systems has the potential to provide major benefits in terms of flexible installation and maintenance of field devices, support for monitoring the operations of mobile robots and reduction in costs and problems due to wire cabling.

Usually, there are thousands of sensors in a factory, such as pressure transmitter, flow meter, temperature transmitters, and so on. Until now, wired network are used to connect sensors to transfer sampled process data to control systems. Wired networks are very reliable and stable communication systems for instruments and controls. However, the wired technology is very costly. Therefore, recently a low cost wireless networks are more strongly demanded by customers to be used, for example, in the temporary instrument networks or some non-critical permanent sites.

This project is about to develop the hardware and software for monitoring system by applying the WSNs based on ZigBee Technology which measure the temperature and voltages where all the parameter is displayed through the Graphical User Interfaces (GUI).

## 1.2 Problem Statement

Currently, industrial technology using wired technology in most of their automation system. There are many disadvantages of wired technology such as the high cost of installation, the high failure rate of connectors, and the difficulty in troubleshooting connections are just some of the factors driving used to investigate wired alternatives. The utility of wireless sensor technology is expected to affect many aspects of plant operation, most notably those applications that benefit from the deployment of sensors or networks of sensors.

Sensors are essential to Industrial Automation (IA). They provide the vital link between control systems and the physical world. Today's sophisticated hardware and software for control systems are creating many new possibilities for automation in factories, refineries and processing plants. But cost-efficient use of sensors is restricted in industrial applications by:

- i. The expense of wiring and monitoring sensor networks
- ii. The safety and regulatory obstacles to running cables in constricted or dangerous areas
- iii. Protocol incompatibility between various sensor types and control system hardware or software

The wired connections are not always realistic. Some rural areas are still not wired for broadband Internet connections. This forces users to subscribe to satellite access. Ethernet cables can run a maximum of 100 meters before the signal needs to be boosted. This can cause problems if you don't have an environment that allows this luxury. Remember that the longer the cable is, the more signal loss occurs and the signal travels down the wire. This is why special cables have been developed to help preserve the strength of the signal. However, the use of such technology usually comes at a significantly higher price.

Wire system monitoring is very expensive and it is difficult to get funding to address wiring issues before a system break down and becoming more complex with increasing computerization of operations and of information about it operations .Current practices flow and are limited by the current state of the art of wire systems technology in terms of design, installation, diagnosis and maintenance [1].

### **1.3 Project Objectives**

The objectives of the project are stated as follows:

- a) To implement a monitoring system using WSNs based on ZigBee Technology which consists of hardware and software part.
- b) To build a GUI using Visual Basic 6.0 (VB) software programming language.
- c) To develop a sensor circuit to be integrate with the software component using VB 6.0.
- d) To make an analysis showing performance of the ZigBee wireless sensor network characteristics within indoor and outdoor environment.

### **1.4 Scope of Project**

This project will focus on the design and development of a machine monitoring system consists of a sensory circuit and graphical user interface (GUI) connected using WSN on Zigbee Technology. Scopes of the project are as follow:

- a) To apply the Zigbee Technology based on Wireless Sensor Network (WSN) in the monitoring of operation in wireless manner.
- b) Develop a GUI that able to display data of the monitored system in real time.
- c) To build simple sensor circuit to sense and then pre-determined parameter such as temperature over voltage.
- d) To make a measurement showing performance of the ZigBee wireless sensor network that conducted within indoor and outdoor environment.

## 1.5 Project Report Outline

This report is divided into six chapters. Chapter 1 is basically the introduction part of the project chosen. In this chapter, the project background, problems statements, objectives and scope will be discussed clearly. Besides, elaboration on the project objectives and project scope will be explained in details so that a better view of the project can be obtained.

Chapter 2 and 3 provided the literature reviews where similar project and researches are reviewed, discussed and analyzed. Here, all main aspects of WSN such as its fundamental, network topology, communication protocol and historical development and the case study are covered. Sensors that had been used for the project is state clearly. Since the WSN has been described, the theoretical background of ZigBee based on IEEE standard will be cited clearly. Finally, the software development features and the advantages are described.

The methodology including the hardware and software development in this project is detailed in Chapter 4. Here, all aspects such as literature review, software component involving GUI development, hardware consists of ZigBee module, a DC motor that will be acts as a machine and sensor chosen are explained. Some analysis procedures on how measurement of ZigBee wireless sensor network done are included in this chapter.

Chapter 5 will be explained the results and discussion of project. The result including the GUI component, DC motor and sensor used are described. The result of analysis showing performance of the ZigBee wireless sensor network characteristics conducted within indoor and outdoor environment is also detailed in this chapter. Here, comparison between indoor and outdoor environment is explained based on ZigBee WSN configuration.

Lastly, in Chapter 6, based on the result obtained in previous chapter, the overall measurement and performance of the project is concluded. Last but not the least, possible improvement for future work is also outlined.
