## ACKNOWLEDGEMENTS

Thanks to Allah because of bless I am sincerely appreciative to my lecturer, Mr. Muhd Ridzuan bin Mansor for serving as my supervisor and for providing guidance while conducting the research and the writing of this Projek Sarjana Muda (PSM).

I thank the laboratory management especially the lab technicians for their cooperation and support. I also want to thank my father , Mr Hashim and my mother, Siti Alwiyah for their continued support and encouragement in everything I do. All these years of education have been made possible by their support and love.

Last but not least, I thank everyone who involved directly and indirectly in this project. The sacrifice and commitment given towards me earning my bachelor's degree are indescribable and without them, this PSM thesis would have been impossible. Lastly, hope that all that have been study and research in this thesis can be use as a references to the other student in the future.

Mohd Shaarani bin Mohd Hashim

## ABSTRAK

Matlamat projek ini ialah untuk mereka bentuk dan membangunkan kerangka kereta Formula Student yang baru di mana kerangka yang akan di bangunkan mestilah mempunyai berat yang lebih ringan daripada kerangka yang sedia ada. Ini kerana, jisim adalah salah satu faktor utama yang akan memberi implikasi kepada kelajuan sesebuah kereta. Banyak kajian telah dilakukan semasa projek ini di jalankan untuk mencapai objektif utama projek ini. Kesimpulan yang telah di dapati daripada kajian telah mendapati cara untuk mengurangkan jisim kerangka ini adalah dengan cara mengubah rekabentuk kerangka yang sedia ada. Selain itu, pengurangan penggunaan besi yang berdiameter lebar juga telah dikurangkan. Namun, penggunaan jenis bahan masih di kekalkan seperti kerangka yang lepas. Walau bagaimanapun, setiap perubahan yang di buat mestilah selari dengan peraturan dan spesifikasi yang di keluarkan oleh pertandingan Formula Student. Kekuatan kerangka juga mestilah sama atau lebih kuat daripada kerangka yang sedia ada. Nilai simpulan torsi pula di kira untuk menentukan kadar kekuatan kerangka ini. Analisa regangan juga di lakukan untuk melihat kekukuhan kerangka ini. Kesimpulannya, banyak pengalaman dan pengetahuan yang baru dapt dipelajari hasil daripada kajian ini.

## ABSTRACT

The goal of this project is to design and develop a new chassis which are lightweight than the previous of Formula Student UTeM chassis. This is because weight is the main point that affected the performance of a car. Therefore, a lot of research has been done in order to achieve the main objective of this project. From the research, this can be conclude that the method to reduce weight is by changes the geometry of chassis design and reduce the hollow tubes dimension while the material that are used still same as the previous chassis. However, changes must complying the rules and regulation of competition. The strength also must be equal or greater than the previous. The torsional stiffness value is determined in order to know the stiffness of this chassis. The chassis was later analyses for its structural performance using finite element analysis method to know the critical path and the parts that will give any possible failure effect. As a conclusion, a lot of new experience and knowledge have gather during the period of this project.

B	Design dimension of previous UTeM Formula Varsity chassis	120
C	Design dimension of new design UTeM Formula Varsity chassis	124

## **CHAPTER I**

### **INTRODUCTION**

Formula Varsity race car is a competition that is organized by Universiti Teknikal Malaysia Melaka in the quite few years. The competition challenges students to design, analyze, build and race the working model of a racing car in real track condition. The design guidelines were based on the specifications ruled by Formula Varsity 2008 event.

This report deals with the design of the chassis including the method that has been applied in development a formula style race car chassis.

#### **1.10 Objective**

The main objective of this project are to design and development of the Formula Style Race Car which is lightweight than a previous car's chassis. New chassis must be lighter than previous but maintain strength.

## **1.20 Problem Statement**

The design of a chassis for a formula style race car contains all the necessary components to support the car and the driver. It must comply with the Formula Varsity rules and regulation. In order to produce a competitive vehicle with optimum chassis performance, many areas need to be studied and tested.

Weight is the main point that affected the performance of the car. Therefore, the main purpose of this project is to design and develop a lightweight chassis. The new chassis is must be lighter than the past year chassis but must maintain the strength of the chassis when load is applied on it.

Some factors that can affect the weight of a vehicle are the types of material used, the diameter or dimension of tubes use to built space frame chassis, and the design geometry of chassis.

This project was started by performing background research required to sustain an accurate database of design criteria. Design criteria is allowed the design process and methodology to be derived as well as and to allow for smooth construction of an efficient and effective space frame chassis. Once construction of the chassis was completed, analyses were conducted to investigate the effects of working loads on the chassis. Finite element analysis was used to simulate the conditions of various load combinations.

## **1.30 Scope**

- i. Produce the detail design of a new chassis using 3D CAD software based on UTeM Formula style competition and regulation

- ii. Select suitable material for the chassis through material selection analysis.
- iii. Evaluate the torsional stiffness for the chassis based on the load analysis.
- iv. Perform Finite Element Analysis on chassis.
- v. Fabricate the new design of Formula Style Race Car chassis.
- vi. Make a comparison about the torsional stiffness value and weight reduction of the new design chassis with the previous car's chassis.

## **CHAPTER II**

### **LITERATURE REVIEW**

#### **2.10 Competition**

##### **2.1.0 Competition rules**

Adhering to the rules that govern the chassis for the competition is a pivotal part of the research. If one small sub-section rule is not followed, the chassis will disqualify the whole car from the competition.

Within the competition rules that are solely for the chassis when attempting to insure all the rules are met, it is easy to miss small details when the rules are set out in this form. Therefore, to simplify this process a summary of the rules was created and broken down into all individual areas of the chassis layout. These areas were, Main Hoop, Front Hoop, Bulkhead, Main Hoop Bracing, Front Hoop Bracing, Bulkhead Support, Other Bracing and Side Impact Members.

The summarized version of the rules can be found in Appendix A. Along with this summary of the rules come some diagrams that relate to the safety aspect of the car as shown in following figure.

Figure 2.1: Illustration of the side impact member's location.

(Sources: Formula SAE Rules (2009))

Figure 2.2: Illustration of the clearance required above the drivers head.

(Sources: Formula SAE Rules (2009))
