

DESIGN OF GRAPHICAL USER INTERFACE (GUI) FOR 68000
MICROPROCESSOR PROGRAMMER

LIM SOON FOOI

This report is submitted in partial fulfillment of the requirement for the award of
Bachelor of Electronic Engineering (Industrial Electronic Engineering) With Honours

Faculty of Electronic and Computer Engineering
Universiti Teknikal Malaysia Melaka

May 2008

UNIVERSITI TEKNIKAL MALAYSIA MELAKA
FAKULTI KEJURUTERAAN ELEKTRONIK DAN KEJURUTERAAN KOMPUTER

BORANG PENGESAHAN STATUS LAPORAN
PROJEK SARJANA MUDA II

Tajuk Projek : Design of Graphical User Interface (GUI) For 68000
Microprocessor Programmer

Sesi Pengajian : 2007/2008

Saya **LIM SOON FOOI** mengaku membenarkan Laporan Projek Sarjana Muda ini disimpan di Perpustakaan dengan syarat-syarat kegunaan seperti berikut:

1. Laporan adalah hakmilik Universiti Teknikal Malaysia Melaka.
2. Perpustakaan dibenarkan membuat salinan untuk tujuan pengajian sahaja.
3. Perpustakaan dibenarkan membuat salinan laporan ini sebagai bahan pertukaran antara institusi pengajian tinggi.
4. Sila tandakan () :

SULIT*

(Mengandungi maklumat yang berdarjah keselamatan atau kepentingan Malaysia seperti yang termaktub di dalam AKTA RAHSIA RASMI 1972)

TERHAD*

(Mengandungi maklumat terhad yang telah ditentukan oleh organisasi/badan di mana penyelidikan dijalankan)

TIDAK TERHAD

Disahkan oleh:

Date	:	9 May 2008

“I hereby declare that I have read this report and in my opinion this report is sufficient in terms of the scope and quality for the award of Bachelor of Electronic Engineering (Industrial Electronics) With Honours.”

Signature : 

Supervisor's Name : Mr. ZAMRE BIN ABD GHANI

Date : 9 May 2008

Dedicated to my beloved family especially father & mother, teacher, lecturer and to all my friends.

ACKNOWLEDGEMENTS

I would like to express appreciate to my mother, Mdm. Kok Phaik Har, because advised me to study science stream during secondary school. If not, today, I would not in electronics field. I would like to thank my brothers and sister because they had supported me in term of moral, fund and transportation in my university life.

I appreciate to Mr. Nor Zaidi Bin Haron, because he created and introduced this project title to me. I appreciate to Mr. Zamre Bin Abd Ghani, because he was willing to supervise and give comments in final semester. I would like to thank the technician in Microprocessor Laboratory, Miss Syahida, who always ready to serve and help me.

I would like to express gratitude to my former industry training supervisor, Mr. Lim Chin Song, who is the software manager at Affinext Innovation Sdn. Bhd. because had given me the idea on data capturing and time delay in programming.

ABSTRACT

The aim of this project is to develop a software which can perform assemble, link and download hex code into 68000 Microprocessor Programmer. In order to meet the objectives, a user friendly Graphical User Interface (GUI) has been designed using Visual Basic. The designed software is user friendly software because it is able to replace the traditional bulky programming method which uses Microsoft Disc Operating System (MS-DOS). The traditional programming needs more than 30 commands lines but this new software only based on three main command buttons. The assemble function and link function can be done by just clicking a single button respectively. Besides, the HyperTerminal programming can be replaced by a button with adding reset pressing and text file sending. In order to improve the functionality of this software, a text editor was designed for writing, opening, and editing purposes. 'New' command button is used to clear the text box, while 'Save' command button is used to save the assembly source codes. The properties setting of serial communication also can be done on the properties setting window. Beside assemble source file, listing file, object file and hex file also can be displayed on the GUI. Microsoft Visual Basic and Dynamic Link Library (DLL) which are very important in methodology are the technologies that had been used to achieve the objectives of this project successfully.

ABSTRAK

Tujuan projek ini adalah untuk membina sebuah perisian antara muka (GUI) yang mempunyai fungsi untuk menghimpun, menyambung dan memindah heksa kod kepada 68000 Mikropemproses di Makmal Mikropemproses FKEKK. Demi mencapai objektif projek ini, satu antara muka (GUI) yang senang diguna telah dibangunkan dengan menggunakan Visual Basic. GUI ini dikatakan senang diguna kerana perisian ini mampu menggantikan atur cara tradisi yang susah diguna iaitu atur cara dengan menggunakan Microsoft Disc Operating System (MS-DOS). MS-DOS memerlukan lebih daripada 30 atur cara tetapi GUI ini hanya berdasarkan tiga objek butang. Fungsi untuk menghimpun dan menyambung dapat dilakukan hanya dengan menekan satu objek butang masing-masing. Selain itu, atur cara untuk HyperTerminal dapat diganti dengan satu objek butang serta menekan reset termasuk memindah heksa fail. Demi meningkatkan fungsi-fungsi GUI ini, 'Text Editor' direka untuk tujuan menulis, membuka dan mengubahsuai atur cara penghimpun. 'New' objek butang direka untuk memadam teks, manakala 'Save' direka untuk menyimpan atur cara penghimpun. 'Properties Settings' untuk RS-232 dapat digubah di tertingkap 'Properties Settings'. Jenis fail yang lain seperti .lst, .obj dan .S28 juga dapat dipaparkan oleh GUI. Microsoft Visual Basic dan Dynamic Link Library (DLL) merupakan teknologi yang paling penting dalam metodologi, telah digunakan untuk mencapai objektif projek ini dengan jayanya.

CHAPTER I

INTRODUCTION

Human can interact with a computer and computer-controlled devices via Graphical User Interface (GUI). A Graphical User Interface (GUI) is a type of user interface which employs graphical icons, visual indicators or special graphical elements, along with text, labels or text navigation to represent the information and actions available to a user. This project is to design a Graphical User Interface (GUI) to improve the quality of 68000 Microprocessor Programmer by replacing the Microsoft Disc Operating System (MS-DOS). As a result, user can save a lot of time if they change from MS-DOS interface to Graphical User Interface (GUI). This project cannot base on simple Visual Basic programming only because other concept and programming techniques are also needed. The other techniques include components technology, Active-X, Application Programming Interface (API) and dynamic-link library (DLL).

1.1 Project's Introduction

Existing 68000 Microprocessor's Programmer use Microsoft Disc Operating System (MS-DOS) to assemble and link for generating hex code. Also, HyperTerminal is used to download the hex code to the target board. Both methods waste a lot of time because involving many steps. It is because MS-DOS and HyperTerminal are a Command Line Interface (CLI) [1]; that require commands to be typed from the keyboard. The command lines are numerous and typing the command lines needs long time. However, the complicated operation and numerous command lines can be completed just using few command buttons if Graphical User Interface (GUI) method is used.

1.2 Objectives

The objectives of this bachelor degree's projects are:

- a) To develop a function on Graphical User Interface (GUI) to perform assembles for 68000 Microprocessor's assembly source code.
- b) To develop a function on Graphical User Interface (GUI) to perform link for 68000 Microprocessor's object file.
- c) To develop a function on Graphical User Interface (GUI) to perform hex code download to the 68000 Microprocessor Programmer.
