BORANG PENGESAHAN STATUS LAPORAN PSM

JUDUL: NOISE INSULATOR FROM NATURAL FIBER COMPOSITE

SESI PENGAJIAN: 2 - 2008/2009

Saya MOHD NOOR IKHWAN BIN MOHD FAUZI

mengaku membenarkan laporan PSM/tesis (Sarjana/Doktor Falsafah) ini disimpan di Perpustakaan Universiti Teknikal Malaysia Melaka (UTeM) dengan syarat-syarat kegunaan seperti berikut:

1. Laporan PSM/tesis adalah hak milik Universiti Teknikal Malaysia Melaka dan penulis.
2. Perpustakaan Universiti Teknikal Malaysia Melaka dibenarkan membuat salinan untuk tujuan pengajian sahaja dengan izin penulis.
3. Perpustakaan dibenarkan membuat salinan laporan PSM/tesis ini sebagai bahan pertukaran antara institusi pengajian tinggi.
4. *Sila tandakan (✓)

SULIT

(Mengandungi maklumat yang berdarjah keselamatan atau kepentingan Malaysia yang termaktub di dalam AKTA RAHSIA RASMI 1972)

TERHAD

(Mengandungi maklumat TERHAD yang telah ditentukan oleh organisasi/badan di mana penyelidikan dijalankan)

TIDAK TERHAD

(TANDATANGAN PENULIS)

Alamat Tetap:
LOT 2798,
KG BUKIT CINA,

Saudara,

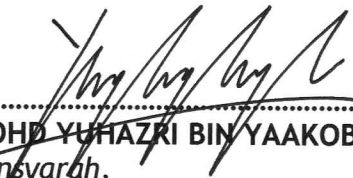

PENKELASAN LAPORAN PSM SEBAGAI SULIT/TERHAD
- LAPORAN PSM SARJANA MUDA KEJURUTERAAN PEMBUATAN (BAHAN
KEJURUTERAAN): MOHD NOOR IKHWAN BIN MOHD FAUZI
TAJUK: NOISE INSULATOR FROM NATURAL FIBER COMPOSITE

Sukacita dimaklumkan bahawa tesis yang tersebut di atas bertajuk “**NOISE INSULATOR FROM NATURAL FIBER COMPOSITE**” mohon dikelaskan sebagai terhad untuk tempoh lima (5) tahun dari tarikh surat ini memandangkan ia mempunyai nilai dan potensi untuk dikomersialkan di masa hadapan.

Sekian dimaklumkan. Terima kasih.

“BERKHIDMAT UNTUK NEGARA KERANA ALLAH”

Yang benar,

.....
MOHD YUHAZRI BIN YAAKOB
Pensyarah,
Fakulti Kejuruteraan Pembuatan
Universiti Teknikal Malaysia Melaka(UTeM)
Karung berkunci 1200, Ayer Keroh,
75450, Melaka

DECLARATION

I hereby, declared this report entitled “**NOISE INSULATOR FROM NATURAL FIBER COMPOSITE**” is the result of my own research except as cited in the references.

Signature :

Author's Name : Mohd Noor Ikhwan B Mohd Fauzi

Date : 22 MAY 2009

APPROVAL

This report is submitted to the Faculty of Manufacturing Engineering of UTeM as a partial fulfillment of the requirements for the degree of Bachelor of Manufacturing Engineering (Engineering Material). The members of the supervisory committee are as follow:

.....
Mohd Yuhazri Bin Yaakob
(Principal Supervisor)

ABSTRACT

Due to high interest in high quality but low cost material, lots of researches have been done by the researcher and engineers. Together with the increasing usage of composite material from mixture of natural materials nowadays, this technical report will proposed a research titled '*Noise Insulator from Natural Fiber Composite*'. Coconut fiber and natural rubber is the material selected for this research as it offer lots of advantage which it has high quality as well as easy to found especially in Malaysia. This mixture of coconut fiber and natural rubber is mixed together in cold press process in a mold to fabricate the composite with different composition of natural rubber by increasing 5 percent of weight for each sample which is start from 0 percent up until 60 percent of natural rubber respectively. Mold of ten millimeters in thickness is prepared as the mold of the specimen preparation. A actual specimen will be as comparison to the specimens with natural rubber for its mechanical properties. These four specimens will then be tested with Tensile Test, Compression test, Moisture Absorption Test and Noise absorption Test to make assessment. From the results obtained, the best specimen will be chosen for Noise Insulator application.

ABSTRAK

Seiring dengan permintaan yang tinggi untuk bahan yang berkualiti dan berkos rendah, banyak kajian telah dilakukan oleh para pengkaji dan jurutera. Sejalan dengan penggunaan bahan komposit daripada campuran bahan semula jadi yang semakin meluas masa ini, laporan teknikal ini membentangkan hasil kajian yang bertajuk *Noise Insulator from Natural Fibers Composite*. Sabut kelapa dan getah asli semula jadi adalah bahan mentah yang digunakan dalam kajian ini. Campuran sabut kelapa dengan getah asli semula jadi dihasilkan menerusi proses mampatan menggunakan kaedah mampatan acuan untuk mengfabrikasi komposit dengan kadar kenaikan 5% bg setiap sampel bermula 0% kandungan getah asli semula jadi hingga 60% kandungan getah asli semulajadi di dalam setiap sampel plat acuan setebal 10mm disediakan sebagai acuan untuk penyediaan sampel. Sampel sabut kelapa sepenuhnya juga difabrikasi untuk tujuan perbandingan sifat mekanik nya dengan sabut kelapa yang diisi dengan getah asli semula jadi. Keempat-empat sampel ini akan diuji dengan ujian tegangan, ujian mampatan, ujian penyerapan kelembapan dan ujian bunyi bagi setiap sampel untuk dibuat penilaian. Daripada keputusan yang diperolehi, hasil yang terbaik akan dijadikan produk yang sesuai untuk perendam atau penebat bunyi.

DEDICATION

Special gift to my family especially to my beloved parents, Abah, Mohd Fauzi Bin Abdul Razak and Ma, Gayah Bte Sulaiman, to my supportive brothers and sisters, to my supervisors, thanks for the priceless knowledge you provided to me and also to all my friends. May Allah S.W.T bless all of you.

ACKNOWLEDGEMENT

In the name of ALLAH, Most Gracious, Most Merciful.

Dengan Nama ALLAH yang Maha Pemurah, Lagi Mengasihani.

I would like to express my appreciation to the individuals who had played a part in ensuring a successful occurrence and flow of activities throughout the duration of my final year project. Endless appreciation and gratitude to my supervisor, Mohd Yuhazri Bin Yaakob for the encouragement and support and spending quite time with myself, providing a lot of guidance and ideas for my project research. Their knowledge and experience really inspired and spurred myself. I truly relished the opportunity given working with them. Last but not least, my appreciation to all technicians involved to complete this project especially to polymer and material lab in UTeM. Finally, my sincere appreciation is dedicated to my family especially Abah and Ma for prayer, harmful support and all the guidance to make sure I stand as like as nowadays. Not forgotten, as well as all friends for their priceless assistance and patronage throughout the process of data gathering and also the idea's regarding this project. Thank you all of you.

CHAPTER 1

INTRODUCTION

In this chapter, there are briefly discussed about the main body part of the thesis. In this chapter, it's focused about the Noise insulator from natural fiber composite. This chapter contain background, problem statement, objective, scope and rational of research.

1.1. Background

Noise pollution generally refers to unwanted sound produced by human activities unwanted in that it interferes with communication, work, rest, recreation, or sleep. Unlike other forms of pollution, such as air, water, and hazardous materials, noise does not remain long in the environment. However, while its effects are immediate in terms of disturbance, they are cumulative in terms of temporary or permanent hearing loss. Society has attempted to regulate noise since the early days of the Romans, who by decree prohibited the movement of chariots in the streets at night. In the United States, communities since colonial days have enacted ordinances against excessive noise, primarily in response to complaints from residents. It was not until the late 1960s, however, that the federal government officially recognized noise as a pollutant and began to support noise research and regulation. Federal laws against noise pollution included the National Environmental Policy Act of 1969, especially sections concerning environmental impact statements; the Noise Pollution and Abatement Act of 1970; and the Noise Control Act of 1972, which appointed the Environmental Protection Agency (EPA) to coordinate federal research and activities in noise control.

Noise intensity is measured in decibels units. The decibel scale is logarithmic; each 10 decibel increase represents a tenfold increase in noise intensity. Human perception of loudness also conforms to a logarithmic scale; a 10 decibel increase is perceived as roughly a doubling of loudness. Thus, 30 decibels is 10 times more intense than 20 decibels and sounds twice as loud; 40 decibels is 100 times more intense than 20 and sounds 4 times as loud; 80 decibels is 1 million times more intense than 20 and sounds 64 times as loud. Distance diminishes the effective decibel level reaching the ear. Thus, moderate auto traffic at a distance of 100 ft (30 m) rates about 50 decibels. To a driver with a car window open or a pedestrian on the sidewalk, the same traffic rates about 70 decibels; that is, it sounds 4 times louder. At a distance of 2,000 ft (600 m), the noise of a jet takeoff reaches about 110 decibels approximately the same as an automobile horn only 3 ft (1 m) away.

Subjected to 45 decibels of noise, the average person cannot sleep. At 120 decibels the ear registers pain, but hearing damage begins at a much lower level, about 85 decibels. The duration of the exposure is also important. There is evidence that among young Americans hearing sensitivity is decreasing year by year because of exposure to noise, including excessively amplified music. Apart from hearing loss, such noise can cause lack of sleep, irritability, heartburn, indigestion, ulcers, high blood pressure, and possibly heart disease. One burst of noise, as from a passing truck, is known to alter endocrine, neurological, and cardiovascular functions in many individuals; prolonged or frequent exposure to such noise tends to make the physiological disturbances chronic. In addition, noise-induced stress creates severe tension in daily living and contributes to mental illness.

Fiber reinforcement composite materials widely use in mainly industry such as air craft, space structures and robot arms because have high specific strength and damping ratio. Composite is a combination of two or more materials, for example, fiberglass and epoxy where fiberglass will act as reinforcement and while epoxy will act as matrix. Combination of materials should be more than 5 percent to be the composite. If the combination less than 5 percent, it's called as impurities and not composite. Composite also present in interphase. The main function interphase is to

transfer the stress from matrix to fibers. Composite also have a different mechanical or physical properties if compare to the original materials (raw materials).

1.2 Problem Statement

Noise control is very important nowadays and not even limited to our daily life. The noise control is very important to in industry both small and medium or high technology industries. Noise can cause major problems and not only limited to the physical condition but it's also can affected mentally itself.

The purpose for this research is to produce new inventor insulator for reducing excessive noise. Noise insulator already used, but this research to design the noise insulator from natural fiber composite. Mostly insulator used the petroleum based to produce noise, vibration and heat insulator. This research will study the potential for the natural fiber composite.

1.3 Objectives

- (a) To identify the mechanical and physical properties of natural fiber and natural rubber.
- (b) To design and fabricate the noise insulator material from natural fiber composite.

1.4 Scope

- (a) Study coconut as a reinforcement agent in natural fiber composite.
- (b) Study natural latex as matrices in natural fiber composite.
- (c) Study mechanical properties in natural fiber composite.
- (d) Study the potential of natural fiber composite as a noise insulator.
