BORANG PENGESAHAN STATUS LAPORAN PSM

JUDUL:

Design and Development of Robot Interface for Controlling 6 DC Motor using Visual Basic

SESI PENGAJIAN: **Semester 2 (2008/2009)**

Saya **ABU UBAIDAH BIN ABDUL AZIZ** mengaku membenarkan laporan PSM / tesis (Sarjana/Doktor Falsafah) ini disimpan di Perpustakaan Universiti Teknikal Malaysia Melaka (UTeM) dengan syarat-syarat kegunaan seperti berikut:

1. Laporan PSM / tesis adalah hak milik Universiti Teknikal Malaysia Melaka dan penulis.
2. Perpustakaan Universiti Teknikal Malaysia Melaka dibenarkan membuat salinan untuk tujuan pengajian sahaja dengan izin penulis.
3. Perpustakaan dibenarkan membuat salinan laporan PSM / tesis ini sebagai bahan pertukaran antara institusi pengajian tinggi.
4. *Sila tandakan (√)

SULIT

(Mengandungi maklumat yang berdarjah keselamatan atau kepentingan Malaysia yang termaktub di dalam AKTA RAHSIA RASMI 1972)

TERHAD

(Mengandungi maklumat TERHAD yang telah ditentukan oleh organisasi/badan di mana penyelidikan dijalankan)

TIDAK TERHAD

(ABU UBAIDAH B. ABDUL AZIZ)

Alamat Tetap:

925-B, Kg. Dato Bentara Luar,
Jln Temenggong Ahmad,
84000 Muar, Johor

(SYAMIMI BINTI SHAMSUDDIN)

Cop Rasmi:

SYAMIMI BINTI SHAMSUDDIN
Pensyarah
Fakulti Kejuruteraan Pembuatan
Universiti Teknikal Malaysia Melaka

Tarikh: 12 Mei 2009

Tarikh: 22 MEI 2009

* Jika laporan PSM ini SULIT atau TERHAD, sila lampirkan surat daripada pihak organisasi berkenaan dengan menyatakan sekali sebab dan tempoh tesis ini perlu dikelaskan sebagai SULIT atau TERHAD.

ABSTRACT

The aim of this project is to design and develop appropriate robot interface using Visual Basic.NET to control six DC motors. The motors will be controlled via computer without direct interaction with a robot pendant. This project has been divided into two stages. The first stage consists of theory of the project such as research on the types of motors that can be used, software package in creating the interface and programming, the controller and the interface. The second stage involves on the design and development of the interface and controller. Programming stage involves two different softwares. Visual Basic.NET programming is used as an interface to control the motor movement while the MikroC is used to program the PIC microcontroller for the PIC to communicate with the Visual Basic.NET programming. Motor controller communicates with PC to control the motors in clockwise and counterclockwise direction through the Visual Basic.NET interface. In addition the controller is also able to control the speed of the motor. Testing is done to verify that the motor controller and the interface can communicate with each other. The interface can communicate with the PIC but not able to move the DC motors to go either forward or reverse. Two objectives had been achieved in this project that is designing and developing a robot interface for controlling 6 DC motor using Visual Basic.NET and constructing electrical circuit to control the DC motor. One objective is not achieved that is to interface the Visual Basic.NET program and motor and program the PIC to achieve controlling 6 DC motor using Visual Basic.NET.

ABSTRAK

Projek ini bertujuan untuk mereka dan membina antara muka dalam mengawal enam motor yang berjenis arus terus. Projek ini dijangka akan membolehkan pengawalan motor menggunakan komputer tanpa menggunakan alat kawalan. Projek ini terbahagi kepada dua peringkat. Peringkat pertama mengandungi teori projek seperti kajian tentang jenis-jenis motor yang boleh digunakan, perisian yang digunakan untuk membina antara muka dan program, litar untuk mengawal motor dan antara muka. Peringkat kedua ialah mereka dan membina antara muka dan litar pengawal motor. Peringkat memprogram melibatkan dua jenis perisian yang berbeza. Pengaturcaraan Visual Basic.NET digunakan sebagai penghubungkait bagi mengawal pergerakan motor manakala MikroC akan diprogramkan ke dalam PIC untuk berkomunikasi dengan pengaturcaraan Visual Basic.NET. Litar untuk mengawal motor akan berkomunikasi dengan komputer untuk mengawal motor dalam beberapa arah pergerakan iaitu mengikut arah pergerakan jam dan lawan jam dengan menggunakan penghubungkait yang telah diprogramkan menggunakan Visual Basic.NET. Selain dari itu, pengawal juga akan mengawal kelajuan motor. Ujian ke atas pengawal motor dan penghubungkait dibuat supaya boleh berkomunikasi antara satu dengan yang lain. Antaramuka boleh berkomunikasi dengan PIC tetapi tidak dapat menggerakkan motor mengikut arah pergerakan jam dan lawan jam. Dua objektif Berjaya dicapai dalam projek ini iaitu mereka dan membina antaramuka untuk mengawal enam motor berarus terus menggunakan Visual Basic.NET dan membina litar untuk mengawal motor berarus terus. Satu objektif tidak tercapai iaitu untuk antaramuka antara program Visual Basic.NET dan motor dan memprogram PIC dalam mengawal enam motor berarus terus menggunakan Visual Basic.NET.

DEDICATION

To my supervisors, Mr. Muhamad Arfauz bin A Rahman, Puan Syamimi binti Shamsuddin and lecturers. Not forgotten to my parents, Abdul Aziz bin Zahari and Nik Azizon binti Wan Kadir, and to all my friends.

ACKNOWLEDGEMENT

Firstly, I would like to thank God for the strength, patient and guidance in finished up this project. I also would like to thanks my supervisors, Mr. Muhamad Arfauz bin A Rahman and Puan Syamimi binti Shamsuddin that have give a lot of guidance, knowledge and support for my project.

I also would like to take this chance to thank En. Muhamad Afifi, the programmer in CAIRO because has spent a time to guide me to complete my project.

Last but not least, to my parents, Abdul Aziz bin Zahari and Nik Azizon binti Wan Kadir, and friends for their support.

CHAPTER 1

INTRODUCTION

1.1 Background

This project is aimed to design and develop appropriate robot interface for controlling six Direct Current (DC) motor using Visual Basic (VB) software. The outcome of this project can be used in controlling the motors via personal computer (PC) without direct interaction with robot pendant. Figure 1.1 show an example of connection between PC, motor controller and DC motor and the interface is expected to be user friendly and easy to connect with the current robot controller.

Figure 1.1: Connection between PC, motor controller and DC motor

Generally, the DC motor had been widely used in industry as in the robot arm and robot slider applications. The advantages of using the DC motor is the speed can be controlled and they have the ability to develop very high torque at low speed. The rotation of the motor also can be controlled clockwise and counterclockwise. There are four basic types of DC motor as follows:

- a) Series motor
- b) Shunt motor

- c) Compound motor
- d) Permanent-magnet motor

Visual Basic.NET is the software package use for this project to develop a program for controlling the DC motor. VB.NET is the most popular language for develop programming because it is easy to use. The language not only allows programmers to create simple graphical user interface (GUI) applications, but can also develop complex applications as well.

Figure 1.2 explains about a simplified model for computer control for controlling the 6 DC motor. It starts with the user interface where users give instructions and read information from the control target through the user interface. The software in the computer will process the instructions and send it to the control/interface board through a communication port (serial/USB port). The control/interface board will interpret and execute the instructions according to a pre-written protocol. The instruction will be sent to the DC motor through the drive board/relay and other electronic components on the control/interface board.

Figure 1.2: Simplified model for computer control (PromoChorm Technologies Ltd.)

1.2 Aim and Objectives

This aim is achieved through these objectives:

- a) To design and develop an interface for controlling 6 DC motor using Visual Basic.NET.

- b) To construct electrical circuit to control the DC motor.
- c) To interface the Visual Basic.NET program and motor and program the PIC (Programmable Integrated Circuit) to achieve controlling 6 DC motor using Visual Basic.NET.

1.3 Scope

This project is to design and develop appropriate robot interface for controlling 6 DC motor using Visual Basic.NET software. The robot interface will be a user friendly interface. The motor controller that been developed can control the angle and speed of the DC motor. This project is to understand the functionality and capability of the DC motor. It is also to understand the application of Visual Basic as the interface.

1.4 Problem Statement

In industry, the robot or motors is inclined controlled and programmed using the control pendant. Using the control pendant, the motors had to be controlled in a close range. In this project, the DC motor can be controlled via PC without direct interaction with control pendant. The advantage is the speed of each motors can be controlled and the program can be changed easily.

1.5 Benefits

The potential benefit of this project is the DC motor can be controlled via PC without direct interaction with control pendant.
