ACKNOWLEDGEMENT

First and foremost, all praise is due to Allah, Lord of the worlds for giving us wellness, intellect and strength to do this project and also the following individuals. Without them, it would not be possible for us to complete this project. In particular, I owe a debt of gratitude to our project supervisor En Mohamad Zoinol Abidin for guide, and giving advice and idea to us complete our project. Without her, this project cannot be done.

Next, I would like to say a million thanks to my parents for their support and understanding in allowing me to focus my attention to this project. They have always been the driving force in pushing us to excel in everything that I do. To our friends, all of you have been an inspiration to the both of us.

Finally, I would also like to extend our utmost gratitude to all the lecturers of University Technical Malaysia Malacca (UTeM) for their guidance and patience. Their teachings have thought me that education and knowledge are vital in life if we wish to succeed.

ABSTRACT

Dual Layer Meander Line Antenna is an antenna that can achieve a miniaturized in size of the antenna and give good applicability for portable devices with bandwidth improvement. The design will be simulated using CST Software This antenna has been designed to operate at 2.4GHz which are specified by IEEE 802.11b/g for WLAN. The antenna designed has been done using microstrip antenna. The antenna was fabricated on double-sided FR-4 printed circuit board using an etching etching technique and SMA connector for the feed port. Then, the design has been measured using spectrum analyzer. The comparison between simulation and measurement results for the frequency response, return loss and radiation pattern were presented. The transmitter antenna is horn antenna when measure the radiation pattern .The dual layer meander line antenna has 3dB gain, lower than -10dB with a frequency bandwidth 114MHz.

ABSTRAK

„Dual Layer Slotted Meander Line Antenna“ adalah antenna yang mampu memberi kelebihan melalui saiznya yang kecil dan sesuai untuk alat telekomunikasi mudah alih dengan jalurlebar yang lebih meluas. Antenna ini disimulasikan dengan menggunakan „Computer Simulation Technology“. Antenna ini telah di reka dengan menggunakan „microstrip“ antenna. Antenna ini telah difabrikasikan di atas FR4 dengan pemalar dielektrik 4.7 dan tinggi 1.6mm. Proses antena telah diukur dengan menggunakan Vector Network Analyzer (VNA). Hasil keputusan antara simulasi dan fabrikasi di kaji. Semasa mengukur „radiation pattern“, antena hon telah digunakan sebagai antena penghantar. Hasil kajian, polar radiasi adalah 3dB, „return loss“ adalah seharusnya rendah daripada -10dB dan jalur lebar adalah 114MHz.
