THE DESIGN OF A SMALL SCALE AUTOMATED MACHINE FOR
LEARNING PURPOSE

LIM SENG TAT

This Report Is Submitted In Partial Fulfillment of Requirements for the Bachelor
Degree of Mechanical Engineering (Structure and Material)

Fakulti Kejuruteraan Mekanikal
Universiti Teknikal Malaysia Melaka

May 2007

DECLARATION

I hereby declare that this project report entitled

**THE DESIGN OF A SMALL SCALE AUTOMATED MACHINE FOR
LEARNING PURPOSE**

is written by me and is my own effort and that no part has been plagiarized

without citations.

DEDICATION

Dedicated to my beloved family Father (Mr. Lim Tang Teng), Mother (Mrs Pua Dee), Brother (Lim Seng Jwee), Sisters (Lim Hwee Chin) and also my friends which always be my side

ACKNOWLEDGEMENT

I would like to offer thanks and deepest gratitude from the bottom of my heart for all the support, encouragement and inspirations I obtained through out the duration of this project. The help rendered to me priceless, be it from the smallest of its kind to the largest. They include;

My supervising lecturer, En. Mohd Ruzi bin Haji Harun of which we had a good working relationship, and who offered tremendous help and encouragement,

My second supervising, Mr. Danny Lim Tian Lai from Intellogic Technology Sdn. Bhd. also gives me full of support and advice.

My family, who inspired me whether through the storm and carry on. My beloved, who kept me through it all.

I would like to express greatest thankfulness and appreciation to Ir. Tan Chee Fai who has given advice, suggestion, guideline and information about design process for this project.

PSM staff and relevant personnel who helped in one way or other; friends and peers who are good companions in times of need.

ABSTRACT

This project is presents the designing of a small scale automate machine for learning purpose. The design of this machine is fully study and reviews from the sorting system by using sensor that controlled by programmable logic control (PLC) that currently uses in industry. The main objective of this project is to develop a machine acts as training kit that used for education and training purpose. The machine is formed by mechanical system, pneumatic system, electrical system and control system. It performs the task similar to industry sorting machine and used at demo session in training courses or lectures to show students and trainees the application of automation in industry. The machine is fully automated and able to identify up to three different colors specimen and sort them into different categories.

Execution of this project required application of knowledge on role of Mechanical and Controller. Theoretical knowledge like machine components design, solid mechanic, mechanic of machine, control system etc. required during conceptual design of the machine. Application of knowledge like computer aided design system, process manufacturing, technology of workshop required during constructed the prototype of the machine. A lot of industrial experience and knowledge were gained along executive this project.

A well functioning prototype will be manufactured as the final outcome of the project. This is an industrial project and the specifications and requirements are based on sponsor needs. Enhancement and stepped-up of machine will be made from time to time to fulfill sponsor's requirements.

ABSTRAK

Projek ini melibatkan pembangunan suatu automasi mesin yang bersaiz kecil bertujuan untuk pembelajaran dan latihan. Objektif utama mesin ini dibangunkan adalah sebagai alat makmal atau prototaip untuk mempersembahkan demo aplikasi automasi dalam industri kejuruteraan semasa sesi latihan atau sesi makmal. Projek ini terdiri daripada sistem berisi udara, sistem mekanikal, sistem elektrik dan sistem kawalan. Mesin berfungsi dan aplikasi dengan membezakan tiga jenis warna ke atas spesimen dan bahagikan mereka secara automatik.

Sepanjang pelaksanaan projek ini, ia memerlukan aplikasi pengetahuan mekanikal dan kawalan. Teori-teori pengetahuan seperti mekanik pepejal, rekabentuk, rekabentuk berbantu komputer dan lain-lain perlu diaplikasi sepanjang melaksanakan projek ini. Pelaksanaan projek ini dapat memupuk banyak pengalaman berkaitan industri automasi dan rekabentuk dalam aspek kejuruteraan mekanikal.

Satu prototaip projek ini akan dihasilkan sebagai keputusan akhir projek ini. Projek ini merupakan suatu projek industri. Semua tata syarat dan keperluan perlu dipatuhi sepanjang pelaksanaan projek ini. Perubahan spesifikasi projek ini akan dilakukan dari semasa ke semasa mengikut kehendak penaja projek ini.

CHAPTER 1

INTRODUCTION

1.1 Introduction

In the age of industrial automation, the high speed process for testing and sorting the product are the prominent activity that can enhance the productivity in manufacturing line. The role of automation in industries is becoming increasingly popular globally, as an element of long-term competitive advantage. However, the use of automation in Malaysian industries is still not widespread. Most of the local industries are still using conventional (traditional) material testing and sorting system. This is a disadvantage to them as it is not cost-effective in utilizing and maintaining this type of system at the present moment.

The topic of this project named as: Designing a Small Scale Automate Machine for Education Purpose. A small scale sorting machine will be generated if compare to actual one and it was fully automate and controlled by programmable logic controller (PLC). The project has to start from zero by drafted out concept of design for the machine; then design the mechanism of the machine by determine the

flexibility and stability of machine's structures until construct the PLC programmed and pneumatic system.

The aim of this project is to generate a training kit that will be used on training courses, education lectures or lab sessions to show the application of automation in industry and bear out ease of use of automation in processing and production line. The training kit will be used present a demo to show how a mechanical system aided by programming system to enhance its functions without human intervention. By development of training kit, this will provide convenience for trainer or lecture do their presentation to trainee or students and they easy understand by observe the demo executed by training kit. The purpose of this project is to fulfill requirements in market especially high education institutes, manufacturing industries and semiconductor industries because these areas needed different types of small scale automate machine as training kit for their automation and PLC curriculum. In addition, automation type training kits still deficiency in Malaysia, so it is necessary in development a project in design a small scale automated machine as training kit. The small scale automated machine functions as an automated sorting machine that will differentiate incoming materials and separate them into different channel. The final product of this project will used during training courses, learning lessons or lab sessions to show how machine controlled by PLC and work coordinate between mechanical parts, electrical parts, sensors and pneumatic parts by execute a demo through the small scale machine. Students and trainees will more understand the application of automation in industry usage and this will make automation technology generalization in Malaysia.

There are several important roles should be considered for this project and they included:

- a) Mechanical structure design.
- b) Mechanism of the machine.
- c) Ease of assembly and ease of manufacturing.
- d) Applications of the pneumatic system in automation
- e) Applications of the PLC and sensor in automation

During involve this project; knowledge on mechanical, manufacturing, pneumatic and programming should be applied. This project process starts from geometrical design, conceptual design, detail design, mechanical parts fabrication, machine components assembly, PLC installation, pneumatic system installation up to test run of machine and troubleshooting problem solving. This project brings development of automation industry and familiar application of automation to industrial trainees, engineers and undergraduate students.

1.2 Problems Statement

Automation plays an important role in many industries area to increase processing efficiency and productivity of production lines. Whereas, automation and PLC still not familiar in our country. Development of industry area leans upon development of automation because it reduces production cost and time of completion products. In additions, a lot of local manufacturing industries depend on automation for their production process; they spend a lot of money to import automated machine from foreign country for their company usage. This increases cost of their products and lower their ability to competitive with other countries products. This is a big lost to our country. As a result, technology of automation

should be brought in to Malaysia as it will round into development of Malaysia economy.

To generalize the technology of automation, technology of automation should be brought into Malaysia. Automation and PLC training courses must be provided to engineers, technicians, machinists, and university or college students to indoctrinate them usage and application of automation technology. From the training courses, they will learnt about automation, PLC, machine design and understand those concepts, knowledge and theory related to automation industry. During the training session, training kit should be provided and presenter can do demo shows how automation works and runs to students. But the training kits on market still less and difficult found. Besides, automation involving a lot of mechanical elements and electrical elements, so training kits provided during training session should be as lot as could with different types and each type shows different functions. This will make trainee more understand application of automation in machine.

With the training kit during the training course, student will provided opportunity look through the running process of automate machine and understand the relationship between PLC, sensors, motors and how they coordinated to each other to form a process system; study on how the mechanical parts and electrical parts of machine controlled by PLC. Since the training kit will run the same process as in industry like: sorting, checking and so on but it just with small scale compare to actual one, so this will make student more understand the application of automation technology. By the side, the training kit will perform the process system as well as a real one and this will make student realise application of automation in industry.

Since there is still less of this type of small scale automate machine act as training kit on market, so it is necessary develop a project to fulfill any requirements from industry or education areas. This small scale automate machine not just can be widely used on training courses for industry; it also can be used as education equipments for high education institute for lab session and provide opportunity for student learn on automation.

1.3 Objectives of Project

The aim of this project basically is to develop an automated machine by using PLC as a training kit used for training session. The objectives of the project includes as below:

- a) To design a small scale automate machine that act as training kit used for training and learning purpose.
- b) To design an automate machine by using the concept of sorting to differentiate colors of in coming specimens or materials and separate them effectively.
- c) To design a training kit that shows the application of P.L.C, sensors, motors and pneumatic system in automation and how they work together and incorporate with mechanical components to perform a specific task.
